Our Commitment

For nearly 60 years, Simpson Strong-Tie has steadfastly served the needs of its customers. During that time, our commitment to leading the construction industry in research and development, product testing and customer service has never wavered.

Today, that promise continues to be delivered worldwide – from our manufacturing facilities to the jobsite. Our commitment to maintaining the highest standards of quality and service can be seen when we help educate engineers on applications and specifications, or when we answer questions from contractors or building officials or help train them on a proper installation. We're there to ensure our dealers get their questions answered and to help their customers receive the best service possible.

You can expect Simpson Strong-Tie to be there to assist you. For our more than 2,000 employees, it's not about doing business, it's our about commitment to your success.

KEEP THIS CATALOG – IT IS VALID FOR TWO YEARS

Simpson Strong-Tie publishes the *Wood Construction Connectors* catalog every two years. In an effort to continue to provide our customers with current information on our ever-expanding product line, we publish an addendum on years we don't print a catalog. The addendums contain new product information, updated testing information and any other information needed to keep our customers up to date with our product line. As always, please be sure to visit our website regularly for updates that occur throughout the year – www.strongtie.com.

INTRODUCTION

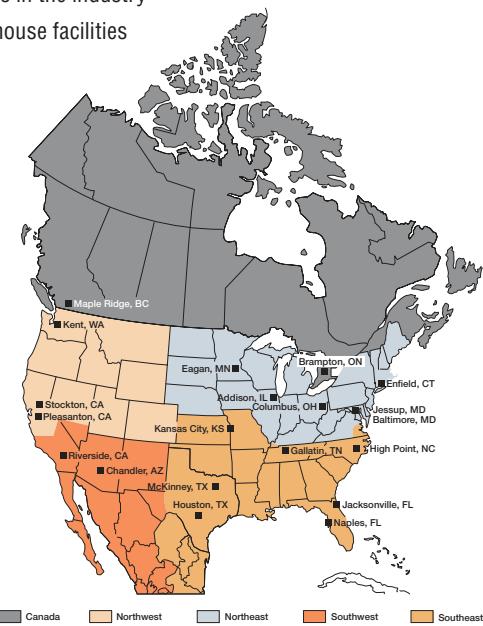

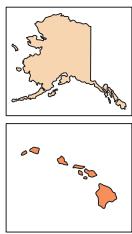

For nearly 60 years, Simpson Strong-Tie has focused on creating structural products that help people build safer and stronger homes and buildings. A leader in structural systems research and technology, Simpson Strong-Tie is one of the largest suppliers of structural building products in the world. The Simpson Strong-Tie commitment to product development, engineering, testing and training is evident in the consistent quality and delivery of its products and services.

For more information, visit the company's Web site at www.strongtie.com.

The Simpson Strong-Tie Company Inc.

"No Equal" pledge includes:

- Quality products value-engineered for the lowest installed cost at the highest rated performance levels
- Most thoroughly tested and evaluated products in the industry
- Strategically located manufacturing and warehouse facilities
- National code agency listings
- Largest number of patented connectors in the industry
- Global locations with an international sales team
- In-house R&D and tool and die professionals
- In-house product testing and quality control engineers
- Support of industry groups including AISI, AITC, ASTM, ASCE, AWC, AWPA, ACI, AISC, CSI, CFSEI, ICFA, NBMDA, NLBMDA, SDI, SETMA, SFIA, STAFDA, SREA, NFBA, TPI, WDSC, WIJMA, WTCA and local engineering groups.

THE SIMPSON STRONG-TIE QUALITY POLICY

We help people build safer structures economically. We do this by designing, engineering and manufacturing "No Equal" structural connectors and other related products that meet or exceed our customers' needs and expectations. Everyone is responsible for product quality and is committed to ensuring the effectiveness of the Quality Management System.

Karen Colonias
Chief Executive Officer

GETTING FAST TECHNICAL SUPPORT

When you call for engineering technical support, we can help you quickly if you have the following information at hand. This will help us to serve you promptly and efficiently.

- Which Simpson Strong-Tie® catalog are you using? (See the front cover for the catalog number)
- Which Simpson Strong-Tie product are you using?
- What is your load requirement?
- What is the carried member's width and height?
- What is the supporting member's width and height?
- What is the carried and supporting members' material and application?

WE ARE ISO 9001-2008 REGISTERED

Simpson Strong-Tie is an ISO 9001-2008 registered company. ISO 9001-2008 is an internationally-recognized quality assurance system which lets our domestic and international customers know that they can count on the consistent quality of Simpson Strong-Tie® products and services.

CONNECTOR SELECTION KEY

Products are divided into fifteen general categories, identified by tabs along the page's outer edge.

Fasteners & Quik Drive® Systems

22-27 ►

Concrete Connectors & Anchors

28-44 ►

Holdowns & Tension Ties

45-54 ►

Caps & Bases

55-71 ►

Solid Sawn Joist Hangers

74-100 ►

Glulam Beam Connectors

101-107 ►

Engineered Wood & Structural Composite Lumber Connectors

108-142 ►

Plated Truss Connectors

143-172 ►

Masonry Connectors

173-185 ►

Straps & Ties

186-208 ►

Decks & Fences

209-219 ►

Miscellaneous

220-227 ►

Architectural Products Group

228-232 ►

Hanger Options

233-243 ►

NEW PRODUCTS FOR 2015

PCZ/EPCZ Post Caps

The new PCZ/EPCZ post caps enable one size to accommodate several post sizes. With post and header flanges now in-line, one PCZ or EPCZ model can accommodate several 4x or 6x post sizes for a variety of lighter-duty applications, including patio covers, trellises and interior framing.

See page 67 for more information.

DTT1Z Deck Tension Tie

The DTT1Z deck tension tie was designed to satisfy a new 2015 IRC provision that allows for four 750 lbs. lateral connections, instead of connecting to the floor joists in the house. The DTT1Z attaches with a $\frac{3}{8}$ " screw fastened into wall plates or studs, thereby eliminating the need to access the joists within the house.

See pages 46 and 209 for more information.

JBA and LBAZ Top-Flange Hangers

The next-generation version of the JB and LB top-flange hangers, respectively, the JBA and LBAZ provide higher loads to accommodate 2x10, 2x12 and 2x14 members. New nail locations allow for use with nailers. The 14 gauge LBAZ may be welded to steel headers.

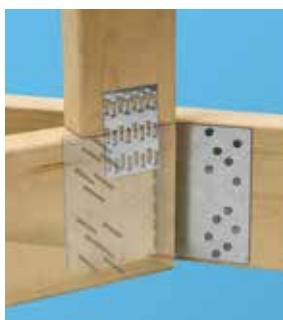

See page 84 for more information.

RPBZ Retrofit Post Base

The new RPBZ retrofit post base serves as reinforcement for many post applications, such as braced patio covers, car ports, trellises and other structures. RPBZ can be installed in conjunction with the CPS composite plastic standoff to meet a 1" post standoff code requirement. A single RPBZ can be installed on a post that is flush to a corner, and two RPBZs can be installed at away from edge conditions to fortify the post base connection to resist both wind and seismic forces.

See page 55 for more information.

TJC57 Jack Truss Connector

The new TJC57 extends this line of versatile connectors for jack trusses. Adjustable from 0 to 85 degrees (*shipped with 67.5 degree bend*). Nail hole locations are placed for easy installation.

See page 153 for more information.

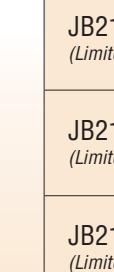

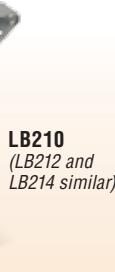

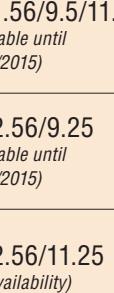

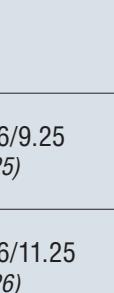

DISCONTINUED PRODUCTS

Products that will be discontinued in 2015

Simpson Strong-Tie is dedicated to continuously expanding our line of structural connectors with innovative new products that address the changing needs of our customers. As new connectors are introduced that improve upon older designs, it becomes necessary to discontinue the old versions in the name of efficiency and product-line simplicity.

The table below lists products that are no longer included in the *Wood Construction Connectors* catalog as well as the products recommended to replace them. While technical information for discontinued products will be maintained on our website for a number of months, Simpson Strong-Tie asks that our customers begin to substitute the replacement products shown below in their designs and inventories. While it is hard to say when they will no longer be available from our distribution partners, production of some of these connectors ended in 2014 and others will be phased out of production in 2015. Verify with Designer prior to substituting replacement product for specified product.

For the most current information on discontinued products visit www.strongtie.com/discontinued. If you have questions about any of the products shown below, please call (800) 999-5099 for assistance.

DISCONTINUED PRODUCT	REPLACEMENT PRODUCT (C-C-2015 Page #)
HANGERS	
	JB210 (Limited availability) → JB210A (page 84)
	JB212 (Limited availability) → JB212A (page 84)
	JB214 (Limited availability) → JB214A (page 84)
	JB214A (JB210A and JB212A similar)
	LB210 (Limited availability) → LB210AZ (page 84)
	LB212 (Limited availability) → LB212AZ (page 84)
	LB214 (Limited availability) → LB214AZ (page 84)
	LB214AZ (LB210AZ and LB212AZ similar)
	ITS1.56/9.5/11.88 (Available until 12/31/2015) → N/A
	ITS2.56/9.25 (Available until 12/31/2015) → LBV2.56/9.25 (page 125)
	ITS2.56/11.25 (No availability) → LBV2.56/11.25 (page 126)
	ITS3.56/9.25/11.25 (Available until 12/31/2015) → LBV3.56/9.25/ 11.25 (page 127)
	IUS2.56/9.25 (No availability) → U310 (page 78)
	HIT3518, 3520, 326, 426 (No availability) → MIT or B Series (page 125)
	LBV2.56/9.25 (Others similar)

HOW TO USE THIS CATALOG

• NEW PRODUCTS

New products are shown with the **NEW** symbol. There are also many new sizes within existing model series.

• CHANGES IN RED

Significant changes from last year's catalog are indicated in red.

VALUE ENGINEERED

This icon indicates a product that is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

EXTRA CORROSION PROTECTION

This icon identifies products that are available with additional corrosion protection (*ZMAX[®], hot-dip galvanized, stainless steel or double-barrier coating*). Other products may also be available with additional protection, contact Simpson Strong-Tie for options. The end of the product name will indicate what type of extra corrosion protection is provided (*Z = ZMAX, HDG = hot-dip galvanized or SS = stainless steel*). See pages 13-15 for information on corrosion, and visit our website www.strongtie.com/info for more technical information on this topic.

STRONG-DRIVE[®] SD CONNECTOR SCREW COMPATIBLE

This icon identifies products approved for installation with the Simpson Strong-Tie[®] Strong-Drive[®] SD Connector screw. See page 27 for more information.

HOW WE DETERMINE ALLOWABLE LOADS

Allowable loads in this catalog are determined by calculations and test criteria established by industry, such as ICC-ES Acceptance Criteria, IAPMO UES Evaluation Criteria and ASTM test standards.

Connectors are typically evaluated in accordance with ICC-ES AC13 – Acceptance Criteria for Joist Hangers and Similar Devices. Evaluation is based on a minimum of three static load tests in wood assemblies. The published allowable load is the lower of the tested ultimate with a safety factor of 3, load at $\frac{1}{8}$ " deflection or the NDS fastener calculation limits.

Holdowns and tension ties are tested in accordance with ICC-ES AC155 – Acceptance Criteria for Hold-Downs (Tie-Downs) Attached to Wood Members. Allowable loads are based on the lower of three static load tests with a safety factor, deflection limits or NDS fastener calculation limits. Static load tests include holdown testing on steel jigs and wood assembly tests.

Cast-in-place concrete products are tested in accordance with ICC-ES AC398 – Cast-in-Place, Cold-Formed Steel Connectors in Concrete for Light-frame Construction or AC399 – Cast-in-Place Proprietary Bolts in Concrete for Light-Frame Construction. Threaded fasteners are evaluated per AC233 – Alternate Dowel-Type Threaded Fasteners.

Where a test standard is unavailable, testing is conducted per sound engineering principles. Some tests include only portions of a product, such as purlin anchor tests only the embedded hook is tested, not the nailed or bolted section of the strap, which is calculated. Testing to determine allowable loads in this catalog is not done on connection systems in buildings. Testing is conducted under the supervision of an independent laboratory.

For detailed information regarding how Simpson Strong-Tie tests specific products, contact Simpson Strong-Tie.

CATALOG DEFINITION:

Deflection: The distance a point moves when a load is applied.

Model No.:

This is the Simpson Strong-Tie product name.

Nails: This shows the fastener quantity and type required to achieve the table loads.

Model No.	W	L	H	Nails	Allowable Loads			Code Ref.
					Non-Cracked	Cracked	Download	
					Uplift	Uplift	Uplift	
Wind and Seismic Design Category A & B								
EPB44A	3 $\frac{1}{16}$	3	2 $\frac{1}{8}$	8-16d	1120	785	2670	I28
EPB44	3 $\frac{1}{16}$	3 $\frac{1}{4}$	2 $\frac{1}{8}$	8-16d	1035	725	3465	
EPB46	5 $\frac{1}{2}$	3 $\frac{1}{16}$	3	12-16d	1035	725	3465	
EPB66	5 $\frac{1}{2}$	5 $\frac{1}{2}$	3	12-16d	1035	725	3465	
Seismic Design Category C-F								
EPB44A	3 $\frac{1}{16}$	3	2 $\frac{1}{8}$	8-16d	940	660	2670	I28
EPB44	3 $\frac{1}{16}$	3 $\frac{1}{4}$	2 $\frac{1}{8}$	8-16d	870	605	3465	
EPB46	5 $\frac{1}{2}$	3 $\frac{1}{16}$	3	12-16d	870	605	3465	
EPB66	5 $\frac{1}{2}$	5 $\frac{1}{2}$	3	12-16d	870	605	3465	

NAILS: 16d = 0.162" dia. x 3 $\frac{1}{2}$ " long.
See pages 22-23 for other nail sizes and information.

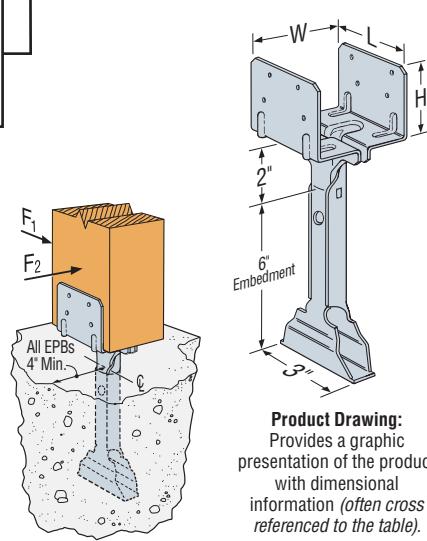

Dimensions W, L, H:
This shows the product dimensions (width, length and height in this case) referenced in the product drawing.

Throughout this catalog a footnote will typically be provided indicating the required nail diameter and length.

All installations should be designed only in accordance with the allowable load values set forth in this catalog.

Code Ref: See page 12 for the Code Reference Key Chart, to determine which code reports include this product.

Wind or Seismic: Some cast-in-place concrete products have different load ratings based on wind or seismic design category.

Product Drawing:
Provides a graphic presentation of the product with dimensional information (often cross-referenced to the table).

CODE REPORTS

Code Reference Column in Load Tables

The alpha-numeric "Code Reference numbers" that appear in the "Code Reference" column in load tables throughout this catalog are intended to identify products listed in evaluation agency reports, typically called "code reports", and the specific reports that cover them. The letter designates which evaluation agency from which the report was obtained. The Code reference column, used in conjunction with the chart at right, indicates which code listing applies to a product. The reference numbers also clearly identify:

- Products submitted for evaluation report listing (160)
- Products with no evaluation report listing (170)
- Products not submitted because they have no load rating and an evaluation report listing is not necessary (180)
- Products that meet prescriptive or conventional construction code requirements (190)
- Product is tested per code; testing is not required (200)

Where a model has been submitted for listing (160) or does not have an evaluation report listing (170), Simpson Strong-Tie can supply complete test data to support our published loads. Please contact us for a copy of our product test documentation at (800) 999-5099. Product acceptance may be obtained through the Alternate Methods and Materials section of the applicable building code.

Some loads and applications may not be covered in the code report and specific reductions and restrictions may be required by other product evaluation agencies. Visit www.strongtie.com or visit the product evaluation agencies' web sites for the current evaluation reports.

Simpson Strong-Tie® products are listed by several product evaluation agencies. Agencies that list our products include ICC-ES; IAPMO UES; UL, FM, the City of Los Angeles, California; and State of Florida.

Simpson Strong-Tie currently maintains more than 60 ICC-ES ESR and IAPMO UES ER reports evaluated to the 2006/2009/2012 IBC and IRC. We continue to submit product information to ICC-ES in order to update reports or receive additional reports for products in compliance with the latest codes.

To quickly determine which of our stamped and welded connector products are listed in ESR reports, we have obtained ICC-ES ESR-2523 index report. This report is a reference document to other ESR reports held by Simpson Strong-Tie and will be updated frequently by ICC-ES as new stamped and welded connector evaluation services reports are issued. Please visit www.strongtie.com for the latest information or contact ICC Evaluation Service at www.icc-es.org.

IAPMO Uniform Evaluation Service has been evaluating products for more than 80 years and has the same ANSI accreditation as ICC Evaluation Service for evaluating structural building products to the building codes. IAPMO UES began evaluating structural building products in 2004, utilizing licensed structural engineers to perform quality reviews. To quickly determine which of our stamped and welded connector products are listed in ER reports, we have obtained IAPMO UES ER-102 index report, which will be updated frequently as products are added to ERs. Please visit www.strongtie.com for the latest information or contact IAPMO Uniform Evaluation Service at www.iapmoes.org.

In November 2010, the California Division of the State Architect, issued a revised IR 23-1. The revised Interpretation of Regulation (IR) addresses and clarifies issues relating to Pre-fabricated Wood Construction Connectors. IR 23-1 defines the Purpose and Scope and clarifies Listing Requirements, Acceptable Load Capacities, Design Requirements, Installation Requirements Connector Fabrication (which addresses corrosion resistant material and/or coatings), and testing requirements. Also IRA-5, updated in October 2012, addresses product and evaluation report acceptance. Please contact the DSA at www.dsa.dgs.ca.gov/Publications/default.htm for more information.

On October 1, 2003, the State of Florida's Statewide Product Approval System became effective. The purpose of this system is to provide a single product evaluation and approval system that applies statewide to operate in coordination with the Florida Building Code. This Florida product evaluation and approval system is governed by Florida Statutes, Chapter 553, Section 553.842. Since this law specifies that the product approval system is to apply statewide, Notice of Acceptance is no longer necessary where a product has a statewide approval that is applicable in the High Velocity Hurricane Zone (HVHZ) and is installed in accordance with its conditions of use.

To access pertinent code reports related to Simpson Strong-Tie® products, you can access our Code Report Finder Software at www.strongtie.com/software.

* Because code reports can be issued throughout the year, we encourage the user to visit www.strongtie.com, www.icc-es.org, www.iapmoes.org, www.ladbs.org, www.dsa.dgs.ca.gov and www.floridabuilding.org for the most current information, call Simpson Strong-Tie at 800-999-5099, or contact the code agency directly.

CORROSION INFORMATION

Understanding the Corrosion Issue

Many environments and materials can cause corrosion including ocean salt air, fire-retardants, fumes, fertilizers, preservative-treated wood, de-icing salts, dissimilar metals and more. Metal connectors, fasteners and anchors could corrode and lose load-carrying capacity when installed in corrosive environments or when installed in contact with corrosive materials.

The many variables present in a building environment make it impossible to accurately predict if, or when, corrosion will begin or reach a critical level. This relative uncertainty makes it crucial that specifiers and users are knowledgeable of the potential risks and select a product suitable for the intended use. It is also prudent that regular maintenance and periodic inspections are performed especially for outdoor applications.

It is common to see some corrosion in outdoor applications. Even stainless steel can corrode. The presence of some corrosion does not mean that load capacity has been affected or that failure is imminent. If significant corrosion is apparent or suspected, then the wood, fasteners and connectors should be inspected by a qualified engineer or qualified inspector. Replacement of affected components may be appropriate.

Some wood-preservative chemicals and fire retardant chemicals and retentions pose increased corrosion potential and are more corrosive to steel connectors and fasteners than others. Testing by Simpson Strong-Tie has shown that ACQ-Type D is more corrosive than Copper Azole Type C, Micronized Copper Azole, and CCA-C. At the same time, others have shown that the inorganic boron treatment chemicals, specifically SBX-DOT, is less corrosive than CCA-C.

Due to the many different chemical treatment formulations, chemical retention levels, moisture conditions and regional formulation variants, selection of fasteners has become a complex task. We have attempted to provide basic knowledge on the subject here, but it is important to fully educate yourself by reviewing our technical bulletins on the topic (www.strongtie.com/info) and also by reviewing information, literature and evaluation reports published by others.

Treatment Use Categories and Exposure Conditions

The American Wood Protection Association (AWPA) identifies 12 Use Category designations (UC) for wood treatment chemicals that are based on protection of the wood material; the Use Categories are based on service conditions and environments and agents of deterioration. At the same time, the building codes require specific corrosion resistance for connectors and fasteners that are in contact with chemically treated wood, and the corrosion resistance is independent of the service environments and treatments that are the basis of the AWPA Use Categories. From the building code perspective, fastener corrosion resistance is provided by hot-dip galvanization applied following ASTM A153, Class D or a corrosion resistant base metal, such as stainless steel, silicon bronze or copper regardless of exposure. Connectors in contact with preservative-treated wood require a minimum of ASTM A653, Type G185 zinc-coated galvanized steel, or equivalent.

Some exceptions are provided in the International Code Council's (ICC) International Residential Code (IRC) for mechanical galvanization applied to screws. The International Building Code (IBC) has exceptions for plain carbon steel fasteners, nuts and washers in SBX/DOT and zinc borate preservative-treated wood in interior, dry environments.

The International Code Council – Evaluation Service (ICC-ES) implemented AC257 as a method to evaluate alternate corrosion resistance mechanisms for fasteners used in wood construction where hot-dip galvanization (ASTM A153, Class D) is used as the benchmark performance. Under AC257, fastener corrosion resistance is qualified for one or more of four exposure conditions with no salt exposure: (1) treated wood in dry-service; (2) clean wood in a salt air dry-service environment; (3) treated wood in a wet-service condition; with no salt exposure; and (4) general use with no limitations.

COATINGS AVAILABLE

Not all products are available in all finishes.
Contact Simpson Strong-Tie for product availability, ordering information and lead times.

Finish/Material	Description	Level of Corrosion Resistance
Gray Paint	Water-based paint intended to protect the product while it is warehoused and in transit to the jobsite.	Low
Powder Coating	Baked on paint finish that is more durable than our standard paint and produces a better looking finished product.	Low
Standard G90 Zinc Coating	Zinc galvanized coating containing 0.90 oz. of zinc per square foot of surface area (<i>total both sides</i>).	Low
Electrocoating (E-Coat™)	Electrocoating utilizes electrical current to deposit the coating material on the fastener. After application, the coating is cured in an oven. Electrocoating provides a minimum amount of corrosion protection and is recommended for dry, non-corrosive applications only.	Low
	Galvanized (G185) 1.85 oz. of zinc per square foot of surface area (<i>hot-dip galvanized per ASTM A653 total both sides</i>). These products require hot-dip galvanized fasteners (<i>fasteners which meet the specifications of ASTM A153</i>).	Medium
	Products are hot-dip galvanized after fabrication (14 ga. and thicker). The coating weight increases with material thickness. The minimum average coating weight is 2.0 oz./ft ² (<i>per ASTM A123 total both sides</i>). These products require hot-dip galvanized fasteners (<i>fasteners which meet the specifications of ASTM A153</i>). Anchor bolts are hot-dip galvanized per ASTM F2329.	Medium
Type 410 Stainless Steel with Protective Top Coat	Carbon martensitic grade of stainless steel which is inherently magnetic, with an added protective top coat. This material can be used in mild atmospheres and many mild chemical environments.	Medium
Mechanically-Galvanized Coating, Class 55	Simpson Strong-Tie Strong-Drive® SD Connector screw is manufactured with a mechanically-applied zinc coating in accordance with ASTM B695, Class 55 with a supplemental overcoat. These fasteners are compatible with painted and zinc-coated (G90 and ZMAX) connectors.	Medium
Double-Barrier Coating	Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screw is manufactured with two different finishes that together provide a level of corrosion protection that equals that provided by the previous HDG coating.	Medium
	Connectors are manufactured from Type 316L stainless steel, and provide greater durability against corrosion. Stainless-steel nails are required with stainless-steel products, and are available from Simpson Strong-Tie.	High/Severe

See Corrosion Information for more specific performance and application information on these finishes.

Simpson Strong-Tie General Recommendations

Simpson Strong-Tie has evaluated the AWPA Use Categories (AWPA U1-U3) and the ICC-ES, AC257 Exposure Conditions and developed from that evaluation a set of Corrosion Resistance Recommendations. These recommendations address the coating systems and materials used by Simpson Strong-Tie for connector and fastener products.

Dry-service (*or damp-service*) environments lead to wood moisture contents less than or equal to 19%. The corrosion potential, even in chemically treated wood, is reduced in these conditions. These conditions are typical of AWPA UC1 and UC2 for wood treatment and AC257 Exposure Condition 1. See the Corrosion Resistance Classification Table for the Simpson Strong-Tie assessment of corrosion needs in these conditions. The AC257 Exposure Condition 2 reflects the presence of air-borne salt in a dry-service environment and corrosion hazard to exposed metal surfaces; it does not include effects of treatment chemicals.

Outdoor environments are generally more corrosive to steel either because the moisture exposure is elevated (*greater than 19%*) and/or the treatment chemical retention level is higher than for interior service. The AWPA classifies exterior above ground treatments as Use Categories UC3 (A and B) depending on moisture run-off; and for ground-contact levels of protection, it has Use Categories UC4 (A-C). ICC-ES considers the exterior exposure to be limited by the type of chemicals and retention level of the chemicals in the qualification testing and whether the exposure includes salt exposure. In general, The AC257 Exposure Condition 3 includes AWPA Use Categories UC1 (*interior dry*) to UC4A (*exterior ground contact, general use*).

Types 316/305/304 stainless steel, copper, silicon bronze and hot-dip galvanized (Class-C) are the most effective protection against corrosion risk, where Type 316 is the best choice for salt marine and chloride containing environments

regardless of treatment chemicals or wood species. If you choose to use hot-dip galvanized (Class-D), mechanically galvanized (C3, N2000, or Class 55), double-barrier or Quik Guard coated fasteners on outdoor projects (*e.g., a deck*), you should periodically inspect the fasteners or have a professional inspection performed, and regular maintenance is a good practice. See the Corrosion Resistance Classifications Table for the Simpson Strong-Tie assessment of the corrosion resistance associated with materials and coatings and an appropriate level of corrosion resistance for various environments.

Due to the many variables involved, Simpson Strong-Tie cannot provide estimates of service life of connectors and fasteners. We suggest that all users and specifiers obtain recommendations on corrosion from the treated wood supplier or for the type of wood used. As long as Simpson Strong-Tie recommendations are followed, Simpson Strong-Tie stands behind its product performance and our standard warranty applies (page 19).

Simpson Strong-Tie does not recommend painting stainless steel fasteners or hardware. The reason behind this recommendation is that sometimes painting can facilitate corrosion. Stainless steel is "stainless" because it forms a protective chromium oxide film on the surface by passive oxidation with air. The paint film on the stainless steel surface may be imperfect or it can be injured during service, and in either case the metal may be exposed. Microscopic-sized film imperfections and scratches facilitate collection of dirt and water that can be stagnant and degrade or block the passive formation of the protective chromium oxide film. When this happens, crevice corrosion can initiate. Crevice corrosion eventually becomes visible as a brown stain or as red rust. This is the reason that painting usually does not improve corrosion resistance of stainless steel.

Guidelines for Selecting Corrosion-Resistant Connectors and Fasteners

Evaluate the Application

Consider the importance of the connection.

Evaluate the Exposure

Consider these moisture and treatment chemical exposure conditions:

- Dry service: Generally INTERIOR applications and includes wall and ceiling cavities, raised floor applications in enclosed buildings that have been designed to prevent condensation and exposure to other sources of moisture. Prolonged exposure during construction should also be considered, as this may constitute a Wet Service or Elevated Service Condition.
- Wet Service: Generally EXTERIOR construction in conditions other than Elevated Service. These include Exterior Protected and Exposed and General Use Ground Contact as described by the AWPA UC4A.
- Elevated Service: Includes fumes, fertilizers, soil, some preservative-treated wood (AWPA UC4B and UC4C), industrial zones, acid rain and other corrosive elements.
- Uncertain: Unknown exposure, materials, or treatment chemicals.
- Ocean/Water Front: Marine environments that include airborne chlorides and some splash. Environments with de-icing salts are included.
- Treatment Chemicals: See AWPA Use Category Designations. The preservative-treated wood supplier should provide all of the pertinent information about the wood being used. The information should include Use Category Designation, wood species group, wood treatment chemical, and chemical retention. See appropriate evaluation reports for corrosion effects of treatment chemicals and fastener corrosion resistance recommendations.

Use the Simpson Strong-Tie® Corrosion Classification Table

If the treatment chemical information is incomplete, Simpson Strong-Tie recommends the use of a 300 series stainless steel product. Also if the treatment chemical is not shown in the Corrosion Classification Table, then Simpson Strong-Tie has not evaluated it and cannot make any recommendations other than the use of coatings and materials in the Severe category. Manufacturers may independently provide test results of other product information; Simpson Strong-Tie expresses no opinion regarding such information.

CORROSION INFORMATION

CORROSION RESISTANCE RECOMMENDATIONS			
Low	Medium	High	Severe
FASTENERS			
Phosphate (gray, black), Clear (bright) zinc (ASTM F1941), Heavy electro-galvanized (ASTM A641-Class 1), Yellow zinc (ASTM F1941), Electrocoat (E-coat), Type 410 stainless steel	Mechanically galvanized (AS 3566.2-C3, N2000, ASTM B695-Class 55), Quik Guard® coating, Hot-dip galvanized (ASTM A153-Class D), Double-barrier coating, Type 410 stainless steel with protective top coat	Type 304 stainless steel, Type 305 stainless steel	Type 316 stainless steel, Hot-dip galvanized (ASTM A153-Class C), Silicon bronze, Copper
CONNECTORS			
Simpson Strong-Tie® gray paint Powder coating Standard G90 zinc coating	ZMAX® (G185) Hot-dip galvanized (ASTM A153 - Class D)	Type 316L stainless steel	Type 316L stainless steel

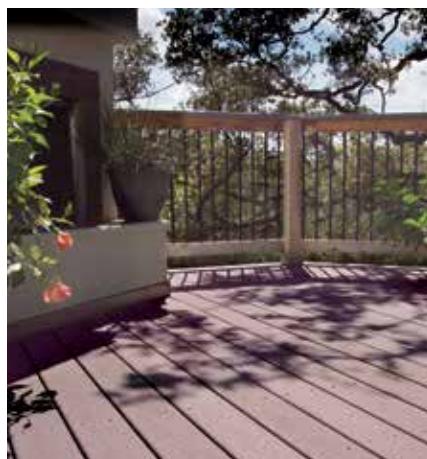

CORROSION RESISTANCE CLASSIFICATIONS							
Environment	Material To Be Fastened						
	Untreated Wood or Other Material	Preservative-Treated Wood					FRT Wood
		SBX-DOT Zinc Borate	Chemical Retention ≤ AWPA, UC4A	Chemical Retention > AWPA, UC4A	ACZA	Other or Uncertain	
Dry Service	Low	Low	Low	High	High	High	Med
Wet Service	Med	N/A	Med	High	High	High	High
Elevated Service	High	N/A	Severe	Severe	High	Severe	N/A
Uncertain	High	High	High	Severe	High	Severe	High
Ocean/Water Front	Severe	N/A	Severe	Severe	Severe	Severe	N/A

1. These are general guidelines that may not consider all application criteria. Refer to product specific information for additional guidance.
2. Type 316/305/304 stainless steel products are recommended where preservative-treated wood used in ground contact has a chemical retention level equal to or greater than those for AWPA UC4A: CA-C, 0.1 pcf; CA-B, 0.21 pcf; micronized CA, 0.20 pcf; ACQ-Type D (or C), 0.40 pcf.
3. Testing by Simpson Strong-Tie following ICC-ES AC257 showed that mechanical galvanization (ASTM B695, Class 55), Quik Guard coating, and Double Barrier coating will provide corrosion resistance equivalent to hot-dip galvanization (ASTM A153, Class D) in contact with chemically treated wood in dry service and wet service exposures (AWPA UC1-UC4A, ICC-ES AC257 Exposure Conditions 1 and 3) and will perform adequately subject to regular maintenance and periodic inspection.
4. Mechanical galvanizations C3 and N2000 should not be used in conditions that would be more corrosive than AWPA UC3A (exterior, above ground, rapid water run off).
5. If uncertain about Use Category, treatment chemical, or environment, use Types 316/305/304 stainless steel, silicon bronze or copper.
6. Some treated wood may have excess surface chemicals making it potentially more corrosive than lower retentions. If this condition is suspected, use Type 316/305/304 stainless steel, silicon bronze, or copper fasteners.
7. Type 316 stainless steel, silicon bronze, and copper fasteners are the best recommendation for ocean salt-air and other chloride-containing environments. Hot-dip galvanized fasteners with at least ASTM A153, Class C protection can also be an alternate for some applications in environments with ocean air and/or elevated wood moisture content.

Interior Dry

Exterior

Severe

IMPORTANT INFORMATION & GENERAL NOTES

WARNING

Simpson Strong-Tie Company Inc. structural connectors, anchors, and other products are designed and tested to provide specified design loads. To obtain optimal performance from Simpson Strong-Tie Company Inc. products and achieve maximum allowable design load, the products must be properly installed and used in accordance with the installation instructions and design limits provided by Simpson Strong-Tie Company Inc. To ensure proper installation and use, Designers and installers must carefully read the following General Notes, General Instructions for the Installer and General Instructions for the Designer, as well as consult the applicable catalog pages for specific product installation instructions and notes.

Proper product installation requires careful attention to all notes and instructions, including these basic rules:

1. Be familiar with the application and correct use of the connector.
2. Follow all installation instructions provided in the applicable catalog, website, *Installer's Pocket Guide* or any other Simpson Strong-Tie publications.
3. Install all required fasteners per installation instructions provided by Simpson Strong-Tie Company Inc.: a) use proper fastener type; b) use proper fastener quantity; c) fill all fastener holes; d) do not overdrive or underdrive nails, including when using gun nailers; and e) ensure screws are completely driven.
4. Only bend products that are specifically designed to be bent. For those products that require bending, do not bend more than once.
5. Cut joists to the correct length, do not "short-cut". The gap between the end of the joist and the header material should be no greater than $\frac{1}{8}$ " unless otherwise noted.

In addition to following the basic rules provided above as well as all notes, warnings and instructions provided in the catalog, installers, designers, engineers and consumers should consult the Simpson Strong-Tie Company Inc. website at www.strongtie.com to obtain additional design and installation information, including:

- Instructional builder/contractor training kits containing an instructional video, an instructor guide and a student guide in both English and Spanish;

- *Installer's Pocket Guide* (form S-INSTALL) which is designed specifically for installers and uses detailed graphics and minimal text in both English and Spanish to explain visually how to install many key products;
- Information on workshops Simpson Strong-Tie conducts at various training centers throughout the country;
- Product specific installation videos;
- Specialty catalogs;
- Code reports – Simpson Strong-Tie® Code Report Finder software;
- Technical fliers and bulletins;
- Master format specifications;
- Material safety data sheets;
- Corrosion information;
- Connector selection guides for engineered wood products (*by manufacturer*);
- Simpson Strong-Tie Connector Selector™ software;
- Simpson Strong-Tie Autocad menu;
- Simpson Strong-Tie Strong-Wall® Selector software;
- Simpson Strong-Tie Anchor Tiedown System Selector and anchor-related software; and
- Answers to frequently asked questions and technical topics.

Failure to follow fully all of the notes and instructions provided by Simpson Strong-Tie Company Inc. may result in improper installation of products. Improperly installed products may not perform to the specifications set forth in this catalog and may reduce a structure's ability to resist the movement, stress, and loading that occurs from gravity loads as well as impact events such as earthquakes and high velocity winds.

Simpson Strong-Tie Company Inc. does not guarantee the performance or safety of products that are modified, improperly installed or not used in accordance with the design and load limits set forth in this catalog.

GENERAL NOTES

These general notes are provided to ensure proper installation of Simpson Strong-Tie Company Inc. products and must be followed fully.

- a. Simpson Strong-Tie Company Inc. reserves the right to change specifications, designs, and models without notice or liability for such changes.
- b. Steel used for each Simpson Strong-Tie® product is individually selected based on the product's steel specifications, including strength, thickness, formability, finish, and weldability. Contact Simpson Strong-Tie for steel information on specific products.
- c. Unless otherwise noted, dimensions are in inches, loads are in pounds.
- d. Unless otherwise noted, welds, screws, bolts and nails may not be combined to achieve highest load value. 8d (0.131"x2½"), 10d (0.148"x3"), and 16d (0.162"x3½") specify common nails that meet the requirements of ASTM F1667. When a shorter nail is specified, it will be noted (for example 8dx1½"). Refer to Simpson Strong-Tie Nailing Guide, NDS (National Design Specification) and ASTM F1667 (American Society of Testing and Materials) for more nail info.
- e. Do Not Overload. Do not exceed catalog allowable loads, which would jeopardize the connection.
- f. Unless otherwise noted, allowable loads are for Douglas Fir-Larch under continuously dry conditions. Allowable loads for other species or conditions must be adjusted according to the code. The section from the AC13 criteria indicating the range of specific gravity reads as follows: **3.2.3** The species of lumber used shall have a specific gravity not greater than 0.55 as determined in accordance with the NDS. This chart shows specific gravity and perpendicular to grain compression capacities for the different wood species:

Species	F _c ⊥	Specific Gravity
Douglas Fir-Larch (DF)	625 psi	0.50
Southern Pine (SP)	565 psi	0.55
Spruce-Pine-Fir (SPF)	425 psi	0.42
Hem Fir (HF)	405 psi	0.43
Glulam	650 psi	0.50
LVL (DF/SP)	750 psi	0.50
LSL (E=1.3x10 ⁶)	680 psi	0.50
LSL (E≥1.5x10 ⁶)	880 psi	0.50
Parallam® PSL	750 psi	0.50

- g. Simpson Strong-Tie Company Inc. will manufacture non-catalog products provided prior approval is obtained and an engineering drawing is included with the order. Steel specified on the drawings as $\frac{1}{8}$ ", $\frac{3}{16}$ ", and $\frac{1}{4}$ " will be 11 gauge (0.120"), 7 ga (0.179"), and 3 gauge (0.239"), respectively. The minimum yield and tensile strengths are 33 ksi and 52 ksi, respectively.
- h. All references to bolts or machine bolts (MBs) are for structural quality through bolts (*not lag screws or carriage bolts*) equal to or better than ASTM Standard A307, Grade A.
- i. Unless otherwise noted, bending steel in the field may cause fractures at the bend line. Fractured steel will not carry load and must be replaced.
- j. A fastener that splits the wood will not take the design load. Evaluate splits to determine if the connection will perform as required. Dry wood may split more easily and should be evaluated as required. If wood tends to split, consider pre-boring holes with diameters not exceeding .75 of the nail diameter (**2012 NDS 11.1.5.3**). Use a $\frac{5}{32}$ " bit for Strong-Drive® SDS Heavy-Duty Connector screws and a $\frac{3}{32}$ " bit for Strong-Drive SD9/SD10 Connector screws.
- k. Wood shrinks and expands as it loses and gains moisture, particularly perpendicular to its grain. Take wood shrinkage into account when designing and installing connections. Simpson Strong-Tie manufactures products to fit common dry lumber dimensions. If you need a connector with dimensions other than those listed in this catalog, Simpson Strong-Tie may be able to vary connector dimensions; contact Simpson Strong-Tie. The effects of wood shrinkage are increased in multiple lumber connections, such as floor-to-floor installations. This may result in the vertical rod nuts becoming loose, requiring post-installation tightening. (*Contact Simpson Strong-Tie for information on Takeup Devices*.)
- l. Top flange hangers may cause unevenness. Possible remedies should be evaluated by a professional and include using a face mount hanger, and routering the beam or cutting the subfloor to accommodate the top flange thickness.
- m. Built-up lumber (*multiple members*) must be fastened together to act as one unit to resist the applied load (*excluding the connector fasteners*). This must be determined by the Designer/Engineer of Record.

IMPORTANT INFORMATION & GENERAL NOTES

GENERAL NOTES (cont.)

- n. Some model configurations may differ from those shown in this catalog. Contact Simpson Strong-Tie for details.
- o. Hanger Options (*Simpson Strong-Tie Hanger Options Matrix and Hanger Option General Notes pages 233-235*) – some combinations of hanger options are not available. In some cases, combinations of these options may not be installable. Horizontal loads induced by sloped joists must be resisted by other members in the structural system. A qualified Designer must always evaluate each connection, including carried and carrying member limitations, before specifying the product. Fill all fastener holes with fastener types specified in the tables, unless otherwise noted. Hanger configurations, height, and fastener schedules may vary from the tables depending on joist size, skew and slope. See the allowable table load for the non-modified hanger, and adjust as indicated. Gauge may vary from that specified depending on the manufacturing process used.
- p. Simpson Strong-Tie will calculate the net height for a sloped seat. The customer must provide the H1 joist height before slope.

- q. Truss plates shown are the responsibility of the Truss Designer.
- r. Do not weld products listed in this catalog unless this publication specifically identifies a product as acceptable for welding, or unless specific approval for welding is provided in writing by Simpson Strong-Tie. Some steels have poor weldability and a tendency to crack when welded. Cracked steel will not carry load and must be replaced. See Simpson Strong-Tie Hanger Options Matrix and Hanger Option General Notes on pages 233-235 for hangers that may be welded.
- s. Unless noted otherwise, all references to standard cut washers refer to Type A plain washers (W) conforming to the dimensions shown in ASME B18.22.1 for the appropriate rod size in accordance with 2012 NDS Appendix L. Some products require SAE narrow washers (N) to fit in a tight space and are noted accordingly.

GENERAL INSTRUCTIONS FOR THE INSTALLER

These general instructions for the installer are provided to ensure proper selection and installation of Simpson Strong-Tie Company Inc. products and must be followed carefully. These general instructions are in addition to the specific installation instructions and notes provided for each particular product, all of which should be consulted prior to and during installation of Simpson Strong-Tie Company Inc. products.

- a. All specified fasteners must be installed according to the instructions in this catalog. Incorrect fastener quantity, size, placement, type, material, or finish may cause the connection to fail. Prior to using a particular fastener, please consult the Fastener Guide in this catalog.
 - 16d fasteners are common nails (0.162" dia. x 3 1/2" long) and cannot be replaced with 16d sinkers (0.148" dia. x 3 1/4" long) for full load value unless otherwise specified.
 - Unless otherwise noted screws may not be used to replace nails in connectors unless approved and recommended by the Designer/Engineer of Record. Unless stated otherwise, Simpson Strong-Tie cannot and does not make any representations regarding the suitability of use or load-carrying capacities of connectors with screws replacing nails.
 - When using stainless-steel connectors, use stainless-steel fasteners. When using ZMAX®/HDG galvanized connectors, use fasteners that meet the zinc coating specifications of ASTM A153 or other fasteners allowed in this catalog.
- b. Fill all fastener holes as specified in the installation instructions for that product. Refer to page 23 for the requirements of the various shapes of fastener hole.
- c. Do not overdrive nails. Overdriven nails reduce shear capacity.
- d. Use the materials specified in the installation instructions. Substitution of or failure to use specified materials may cause the connection to fail.
- e. Do not add fastener holes or otherwise modify Simpson Strong-Tie Company Inc. products. The performance of modified products may be substantially weakened. Simpson Strong-Tie will not warrant or guarantee the performance of such modified products.
- f. Install products in the position specified in the catalog.
- g. Do not alter installation procedures from those set forth in this catalog.
- h. The proper use of certain products requires that the product be bent. For those products, installers must not bend the product more than one time (*one full cycle*).
- i. Bolt holes shall be at least a minimum of $\frac{1}{32}$ " and no more than a maximum of $\frac{1}{16}$ " larger than the bolt diameter (*per the 2012 NDS, section 11.1.3.2 and AISI S100-07, Table E3a if applicable*).
- j. Install all specified fasteners before loading the connection.
- k. Some hardened fasteners may have premature failure if exposed to moisture. These fasteners are recommended to be used in dry interior applications.
- l. Use proper safety equipment.
- m. Welding galvanized steel may produce harmful fumes; follow proper welding procedures and safety precautions. Welding should be in accordance with A.W.S. (*American Welding Society*) standards. Unless otherwise noted Simpson Strong-Tie® connectors cannot be welded.
- n. Pneumatic or powder-actuated fasteners may deflect and injure the operator or others. Pneumatic nail tools may be used to install connectors, provided the correct quantity and type of nails (*length and diameter*) are properly installed in the nail holes. Tools with nail hole-locating mechanisms should be used. Follow the manufacturer's instructions and use the appropriate safety equipment. Overdriving nails may reduce allowable loads. Contact Simpson Strong-Tie. Powder-actuated fasteners should not be used to install connectors.
- o. Joist shall bear completely on the connector seat, and the gap between the joist end and the header shall not exceed $\frac{1}{8}$ " per ICC-ES AC261, ASTM D1761 and ASTM D7147 test standards (*unless specifically noted otherwise*).
- p. For holdowns, anchor bolt nuts should be finger-tight plus $\frac{1}{2}$ to $\frac{1}{2}$ turn with a hand wrench, with consideration given to possible future wood shrinkage. Care should be taken to not over-torque the nut. Impact wrenches should not be used as they may preload the holdown.
- q. Holdowns and Tension Ties may be raised off the sill as dictated by field conditions to accommodate an anchor mislocated no more than $1\frac{1}{2}$ ". The holdown shall be raised off the sill at least 3" for every $\frac{1}{4}$ " that the anchor is offset from the model's centerline. Anchor bolt slope shall be no greater than 1:12 (*or 5 degrees*). Contact the Designer if the holdown anchor is offset more than $1\frac{1}{2}$ " or raised more than $18"$. Raised holdown height is measured from the top of concrete to the top of the holdown bearing plate.
- r. Fasteners are permitted to be installed through metal truss plates when approved by the Truss Designer in accordance with ANSI/TPI 1-2007, Section 7.5.3.4 and 8.9.2. Installation of Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws through metal connector plates requires the plates to be pre-drilled using a maximum of a $\frac{9}{32}$ " bit. Do not drive nails through the truss plate on the opposite side of single-ply trusses which could force the plate off the truss.
- s. For cold-formed steel applications, all screws shall be installed in accordance with the screw manufacturer's recommendations. All screws shall penetrate and protrude through the joined materials a minimum of 3 full exposed threads per AISI Standard for Cold Formed Steel Framing – General Provisions, section D1.3, if applicable.
- t. Nuts shall be installed such that the end of the threaded rod or bolt is at least flush with the top of the nut.
- u. When installing hurricane ties on the inside of the wall special considerations must be taken to prevent condensation on the inside of the completed structure in cold climates.
- v. Unless otherwise noted, connectors shown in this catalog have been designed to be installed at the time the framing members are installed. Contact Simpson Strong-Tie for retrofit suitability of specific connectors including those manufactured in accordance with the hanger options section of this catalog.

IMPORTANT INFORMATION & GENERAL NOTES

GENERAL INSTRUCTIONS FOR THE DESIGNER

These general instructions for the Designer are provided to ensure proper selection and installation of Simpson Strong-Tie Company Inc. products and must be followed carefully. These general instructions are in addition to the specific design and installation instructions and notes provided for each particular product, all of which should be consulted prior to and during the design process.

- a. The term "Designer" used throughout this catalog is intended to mean a licensed/certified building design professional, a licensed professional engineer, or a licensed architect.
- b. All connected members and related elements shall be designed by the Designer.
- c. All installations should be designed only in accordance with the allowable load values set forth in this catalog.
- d. Unless otherwise noted, connector allowable loads published in this catalog are limited to the lowest of: average recorded test load at $\frac{1}{8}$ " deflection, lowest ultimate recorded test load of 3 tests specimens divided by 3 (*or the average of 6 specimens divided by 3*), or the calculated value based on steel, wood bearing, and/or fastener capacity.
- e. When a connector is loaded simultaneously in more than one direction, the allowable load must be evaluated as shown here. For all connectors use the following equation:

$$\text{Design Uplift}/\text{Allowable Uplift} + \text{Design Lateral Parallel to Plate} / \text{Allowable Lateral Parallel to Plate} + \text{Design Lateral Perpendicular to Plate} / \text{Allowable Lateral Perpendicular to Plate} < 1.0.$$

The three terms in the unity equation are due to the possible directions that exist to generate force on a connector. The number of terms that must be considered for simultaneous loading is at the sole discretion of the Designer and is dependent on their method of calculating wind forces and the utilization of the connector within the structural system.

As an alternate, certain roof-to-wall connectors (*embedded truss anchors, pages 180 and 181, seismic and hurricane ties, pages 178-179, and twist straps, page 168*) can be evaluated using the following: The design load in each direction shall not exceed the published allowable load in that direction multiplied by 0.75.

- f. Loads are based on the **2012 National Design Specifications (NDS)** and **AISI S100-07** if applicable, unless otherwise specified. Other code agencies may use different allowable loads.
- g. Duration of load adjustments as specified by the code are as follows:
 "FLOOR" and "DOWN" (100)—no increase for duration of load.
 "SNOW" (115)—115% of design load for 2 month duration of load.
 "ROOF LOAD" (125)—125% of design load for 7 day duration of load.
 "EARTHQUAKE/WIND" (160)—160% of design load for earthquake/wind loading.
- h. Unless otherwise noted, wood shear is not considered in the loads given; reduce allowable loads when wood shear is limiting.
- i. Simpson Strong-Tie strongly recommends the following addition to construction drawings and specifications: "Simpson Strong-Tie® connectors are specifically required to meet the structural calculations of plan. Before substituting another brand, confirm load capacity based on reliable published testing data or calculations. The Engineer/Designer of Record should evaluate and give written approval for substitution prior to installation."
- j. Verify that the dimensions of the supporting member are sufficient to receive the specified fasteners, and develop the top flange bearing length.
- k. Some catalog illustrations show connections that could cause cross-grain tension or bending of the wood during loading if not sufficiently reinforced. In this case, mechanical reinforcement should be considered.

- l. For holdowns, anchor bolt nuts should be finger-tight plus $\frac{1}{3}$ to $\frac{1}{2}$ turn with a hand wrench, with consideration given to possible future wood shrinkage. Care should be taken to not over-torque the nut. Impact wrenches should not be used as they may preload the holdown.
- m. Simpson Strong-Tie will provide upon request code testing data on all products that have been code tested.
- n. The allowable loads published in this catalog are for use when utilizing the traditional Allowable Stress Design methodology. A method for using Load and Resistance Factor Design (LRFD) for wood has been published in **ASTM D5457**. A method for using LRFD for cold-formed steel has also been published in the **AISI S100-07**. When designing with LRFD, reference lateral resistances must be used. Contact Simpson Strong-Tie for reference lateral resistances of products listed in this catalog. For more information, refer to the **2012 NDS Appendix N**, which contains a conversion procedure that can be used to derive LRFD capacities.
- o. For joist hangers, Simpson Strong-Tie recommends the hanger height shall be at least 60% of joist height for stability.
- p. For cold-formed steel applications, as a minimum all screws must comply with Society of Automotive Engineers (SAE) Standard J78, Steel Self-Drilling/Tapping Screws, and must have a Type II coating in accordance with ASTM B 633, Electrodeposited Coatings of Zinc on Iron and Steel. Screw strength shall be calculated in accordance with **AISI S100-07** Section E4, if applicable, or shall be based on the manufacturer's design capacity determined from testing.
- q. Local and/or regional building codes may require meeting special conditions. Building codes often require special inspection of anchors installed in concrete and masonry. For compliance with these requirements, it is necessary to contact the local and/or regional building authority. Except where mandated by code, Simpson Strong-Tie products do not require special inspection.
- r. Holdown and Tension Tie allowable loads are based on installations with an anchor rod length of 6" from the concrete to top of holdown seat, yet these products may be raised to any height with consideration of the increased deflection due to additional bolt elongation. For cases where the anchor bolt is offset, Simpson Strong-Tie offers recommendations, subject to the approval of the Designer, which permit holddowns to be raised up to 18" maximum with a corresponding horizontal anchor bolt offset of $1\frac{1}{2}$ ". See "General Instructions for the Installer" (page 17 note q).
- s. Throughout the catalog there are installation drawings showing the load transfer from one element in the structure to another. Additional connections may be required to safely transfer the loads through the structure. It is the Designer's responsibility to specify and detail all necessary connections to ensure that a continuous load path is provided as required by the building code.
- t. Top flange hanger allowable loads are typically based on testing with solid headers. Load reductions may apply when using headers comprised of multiple plies of dimensioned lumber or SCL. See technical bulletin T-MPLYHEADER for more information.

IMPORTANT INFORMATION & GENERAL NOTES

LIMITED WARRANTY

Simpson Strong-Tie Company Inc. warrants catalog products to be free from defects in material or manufacturing. Simpson Strong-Tie Company Inc. products are further warranted for adequacy of design when used in accordance with design limits in this catalog and when properly specified, installed, and maintained. This warranty does not apply to uses not in compliance with specific applications and installations set forth in this catalog, or to non-catalog or modified products, or to deterioration due to environmental conditions.

Simpson Strong-Tie® connectors are designed to enable structures to resist the movement, stress, and loading that results from impact events such as earthquakes and high velocity winds. Other Simpson Strong-Tie products are designed to the load capacities and uses listed in this catalog. Properly-installed Simpson Strong-Tie products will perform in accordance with the specifications set forth in the applicable Simpson Strong-Tie catalog. Additional performance limitations for specific products may be listed on the applicable catalog pages.

Due to the particular characteristics of potential impact events, the specific design and location of the structure, the building materials used, the quality

of construction, and the condition of the soils involved, damage may nonetheless result to a structure and its contents even if the loads resulting from the impact event do not exceed Simpson Strong-Tie catalog specifications and Simpson Strong-Tie connectors are properly installed in accordance with applicable building codes.

All warranty obligations of Simpson Strong-Tie Company Inc. shall be limited, at the discretion of Simpson Strong-Tie Company Inc., to repair or replacement of the defective part. These remedies shall constitute Simpson Strong-Tie Company Inc.'s sole obligation and sole remedy of purchaser under this warranty. In no event will Simpson Strong-Tie Company Inc. be responsible for incidental, consequential, or special loss or damage, however caused.

This warranty is expressly in lieu of all other warranties, expressed or implied, including warranties of merchantability or fitness for a particular purpose, all such other warranties being hereby expressly excluded.

This warranty may change periodically – consult our website www.strongtie.com for current information.

TERMS & CONDITIONS OF SALE

PRODUCT USE

Products in this catalog are designed and manufactured for the specific purposes shown, and should not be used with other connectors not approved by a qualified Designer. Modifications to products or changes in installations should only be made by a qualified Designer. The performance of such modified products or altered installations is the sole responsibility of the Designer.

INDEMNITY

Customers or Designers modifying products or installations, or designing non-catalog products for fabrication by Simpson Strong-Tie Company Inc. shall, regardless of specific instructions to the user, indemnify, defend, and hold harmless Simpson Strong-Tie Company Inc. for any and all claimed loss or damage occasioned in whole or in part by non-catalog or modified products.

NON-CATALOG AND MODIFIED PRODUCTS

Consult Simpson Strong-Tie Company Inc. for applications for which there is no catalog product, or for connectors for use in hostile environments, with excessive wood shrinkage, or with abnormal loading or erection requirements.

Non-catalog products must be designed by the customer and will be fabricated by Simpson Strong-Tie in accordance with customer specifications.

Simpson Strong-Tie cannot and does not make any representations regarding the suitability of use or load-carrying capacities of non-catalog products. Simpson Strong-Tie provides no warranty, express or implied, on non-catalog products. F.O.B. Shipping Point unless otherwise specified.

CONVERSION CHARTS

Metric Conversion

Imperial	Metric
1 in	25.40 mm
1 ft	0.3048 m
1 lb	4.448 N
1 Kip	4.448 kN
1 psi	6895 Pa

Bolt Diameter

in.	mm

3/4	19.1
7/8	22.2
1	25.4

If Common Rafter Roof Pitch is...

Rise/Run	Slope
1/12	5°
2/12	10°
3/12	14°
4/12	18°
5/12	23°
6/12	27°
7/12	30°
8/12	34°
9/12	37°
10/12	40°
11/12	42°
12/12	45°

→
Use these Roof Pitch to Hip/Valley Rafter Roof Pitch conversion tables only for hip/valley rafters that are skewed 45° right or left. All other skews will cause the slope to change from that listed.

Then Hip/Valley Rafter Roof Pitch becomes...

Rise/Run	Slope
1/17	3°
2/17	7°
3/17	10°
4/17	13°
5/17	16°
6/17	19°
7/17	22°
8/17	25°
9/17	28°
10/17	30°
11/17	33°
12/17	35°

Steel thickness varies according to mill standards.

Click and Build

The Joist Hanger Selector software interface is shown on the computer screen. The main window title is "Joist Hanger Selector". The top navigation bar includes links for Home, Products, Resources, Customer Service, Where To Buy, For Homeowners, and About. The SIMPSON Strong-Tie logo is prominently displayed. A sub-menu for "Joist Hangers" is open, showing categories like "Fastener Type" (with "All" selected), "Hanger Options (Slope, Skew, Etc...)" (with "All" selected), and "Design Information (Loads)" (with "All" selected). The main content area is titled "Select Hanger Type" and shows four options: "FACE MOUNT", "TOP FLANGE", "CONCEALED FLANGE", and "ALL TYPES" (which is highlighted with a blue background). Below this, there is a checkbox for accepting the End User License Agreement. The "Header Member" section shows a "SOLID SAWN" option, and the "Joist Member" section also shows a "SOLID SAWN" option. A dropdown menu for "Member Species" is set to "2x(1 1/2")". On the right side of the interface, there is a "CALCULATION RESULTS" section with a table showing various joist sizes and their corresponding dimensions. The table includes columns for "Header", "Width", "Depth", "Thickness", and "Material". Some rows are highlighted in blue, indicating specific calculations or selected models.

Header	Width	Depth	Thickness	Material

Simpson Strong-Tie Apps Are Designed to Help You Do Your Job Faster and Easier

At Simpson Strong-Tie, we believe the principles for introducing new software are no different from designing a new connector. We leverage the latest technology to help Specifiers and builders create safer, stronger structures in less time than ever before. Our unmatched variety of product selector and calculator apps help you find the best product, information and resources needed to do the job right the first time. **And they are all free!**

Visit www.strongtie.com/software to learn more about our technology offerings.

Find the Right Joist Hanger – Fast

The web app enables customers to quickly and easily select the most appropriate and cost-effective hanger for their projects based on the type of installation, type and size of lumber and loads.

Apple, the Apple logo and iPad are trademarks of Apple Inc., registered in the U.S. and other countries.
App Store is a service mark of Apple Inc. Google Play is a trademark of Google Inc.

Match Your Anchor with the Right Connector

Our Connector-Anchor selector software helps discern the required embedment depth of our anchoring products when used with a Simpson Strong-Tie holdown or post base product.

Select the Right Holdown

The Holdown Selector is a quick and easy tool that selects the most cost-effective holdown connector based on the type of installation, demand load and wood species.

Get Simpson Strong-Tie Knowledge on Your Mobile Device

Need to find out how many Simpson Strong-Tie® adhesive cartridges you require for a job? Perhaps you're looking for some literature to learn more about a new product? Simpson Strong-Tie now delivers exciting mobile apps to your iPhone™, iPad™ or Android™ mobile device. Simply download and easily access information about our most popular products and even find the closest Simpson Strong-Tie dealer to purchase them.

CONNECT WITH US!

Now you can connect with Simpson Strong-Tie through several social media channels, including our Structural Engineering Blog.

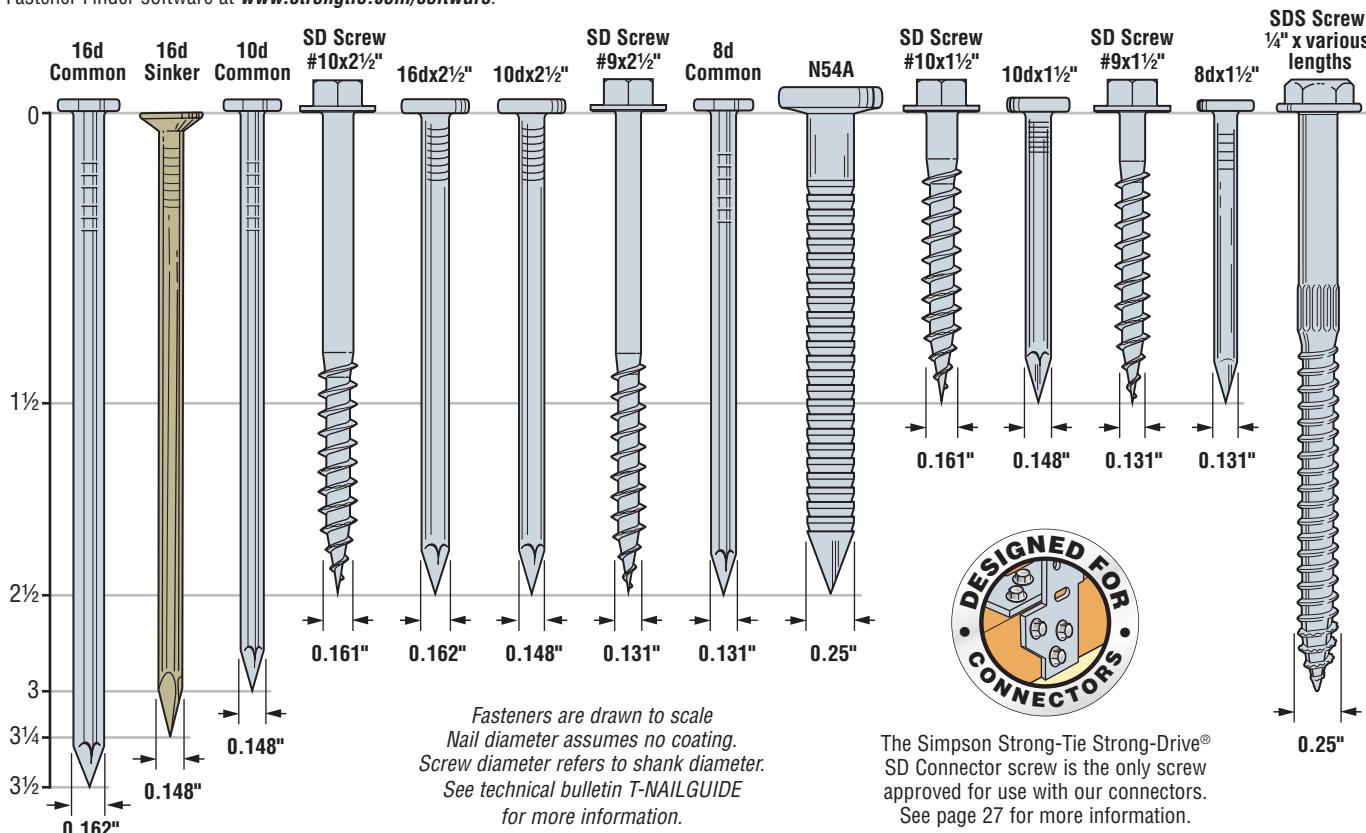

FASTENER TYPES

Fastener Types and Sizes Specified for Simpson Strong-Tie® Connectors

Many Simpson Strong-Tie connectors have been designed and tested for use with specific types and sizes of fasteners. The specified quantity, type and size of fastener must be installed in the correct holes on the connector to achieve published loads. Other factors such as fastener material and finish are also important. Incorrect fastener selection or installation can compromise connector performance and could lead to failure.

Simpson Strong-Tie does not offer all of these fasteners. For more information about fasteners, see our *Fastening Systems* catalog or access our Fastener Finder software at www.strongtie.com/software.

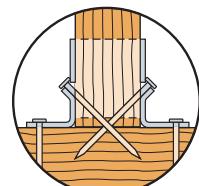

FASTENER DESIGN INFORMATION

In some cases, it is desirable to install Simpson Strong-Tie face mount joist hangers and straight straps with nails that are a different type or size than what is called out in the load table. In these cases, these reduction factors must be applied to the allowable loads listed for the connector.

Load Adjustment Factors for Optional Fasteners Used with Face Mount Hangers and Straight Straps

Catalog Nail	Replacement	Allowable Load Adjustment Factor	
		Face Mount Hangers	Straight Straps
16d common (0.162"x3 1/2")	10dx1 1/2 (0.148"x1 1/2")	0.64	0.84 ⁹

Double-shear nailing
Should use full length
common nails

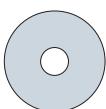

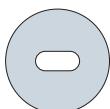

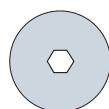

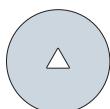

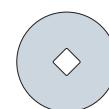

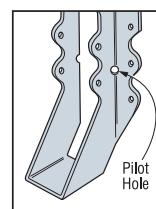

Shorter nails may
not be used as
double shear nails

1. Allowable load adjustment factors shown in the table are based on calculated reduction factors and are applicable for all face mount hangers and straight straps throughout this catalog, except as noted in the footnotes below.
2. Some products have been tested specifically with alternate fasteners and have allowable load adjustment factors or reduced capacities published on the specific product page which may differ from the values calculated using this table.
3. This table does not apply to SUR/L hangers or to hangers modified per the Hanger Options described on pages 233-243, or steel thicker than 10 gauge.
4. Unless noted otherwise, fasteners shorter than 3" in length may not be substituted for specified joist nails in double-shear hangers (i.e. LUS, MUS, HUS, HHUS). For applications involving pneumatic nails, refer to technical bulletin T-PNEUMATIC.
5. Strong-Drive® SD Connector screw substitutions in this table do not apply to sloped, skewed or double-shear hangers. For additional information and specific allowable loads, refer to www.strongtie.com/sd.
6. Nails and Strong-Drive SD Connector screws may not be combined in a connection.
7. Do not substitute 10dx1 1/2" nails for face nails on slope and skew combinations or skewed only LSU and LSSU.
8. For straps installed over sheathing use a 2 1/2" long fastener minimum.
9. Where noted, use 0.80 for 10 ga, 11 ga, and 12 ga products when using SPF lumber.
10. Where noted, use 0.92 for 10 ga, 11 ga, and 12 ga products when using SPF lumber.

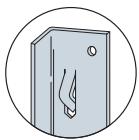

FASTENING IDENTIFICATION

SIMPSON

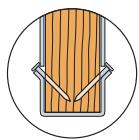

Strong-Tie

**Round Holes****Purpose:** to fasten a connector.**Fill Requirements:** always fill, unless noted otherwise.**Obround Holes****Purpose:** to make fastening a connector in a tight location easier.**Fill Requirements:** always fill.**Hexagonal Holes****Purpose:** to fasten a connector to concrete or masonry.**Fill Requirements:** always fill when fastening a connector to concrete or masonry.**Triangular Holes****Purpose:** to increase a connector's strength or to achieve Max strength.**Fill Requirements:** when the Designer specifies Max nailing.**Diamond Holes****Purpose:** to temporarily fasten a connector to make installing it easier.**Fill Requirements:** none.**Pilot Holes**

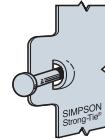

Tooling holes for manufacturing purposes. No fasteners required.

**Speed Prongs**

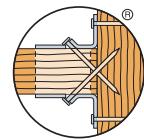

Used to temporarily position and secure the connector for easier and faster installation.

**Positive Angle Nailing (PAN)**

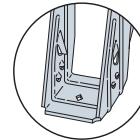

Provided when wood splitting may occur, and to speed installation.

**Dome Nailing**

This feature guides the nail into the joist and header at a 45° angle. U.S. Patent 5,603,580

**Double-Shear Nailing**

The nail is installed into the joist and header, distributing the load through two points on each joist nail for greater strength.

**ITS/IUS Strong-Grip™**

The Strong-Grip™ seat allows the I-joist to "snap" in securely without the need for joist nails.

STRONG-DRIVE® CONNECTOR NAILS

Simpson Strong-Tie nails and structural fasteners have been developed as the optimum fasteners for connector products. Special lengths afford economy of purchase and installation, and depth compatibility with framing members.

For pneumatic nail use, see Instructions to the Installer, page 17 and visit www.strongtie.com for technical bulletins.

Retail Packaging

1 lb. Retail Tub

5 lb. Retail Bucket

Simpson Strong-Tie hot-dip galvanized nails are packed in 1 lb. and 5 lb. plastic retail containers for easy handling.

Nails Sold by the Pound

Nail	Simpson Model No.	Dimensions	Wire Gauge	Finish
8dx1½"	N8	0.131" x 1½" (3.3mm x 38.1mm)	10½	HDG
	SSN8			SS
8d Common	SS8D	0.131" x 2½" (3.3mm x 63.5mm)	10½	SS
10dx1½"	N10	0.148" x 1½" (3.8mm x 38.1mm)	9	HDG

16d Common	16DHG	0.162" x 3½" (4.1mm x 88.9mm)	8	HDG
	SS16D			SS
N54A	N54A	0.250" x 2½" (6.4mm x 63.5mm)	3	Bright
	N54AHG			HDG

1. HDG = hot-dip galvanized; SS = stainless steel; Bright = no finish.
2. For pneumatic fastener info, request additional technical information.
3. Use HDG nails with ZMAX® and HDG products.
4. 16d sinker with GV finish is not acceptable for ZMAX or HDG applications.
5. HDG nails sold by Simpson Strong-Tie meet the specifications of ASTM A153. Stainless-steel nails are type 316 stainless.

COLLATED STRONG-DRIVE® CONNECTOR NAILS

Simpson Strong-Tie® Strong-Drive® SCNR Ring-Shank Connector nails are designed to provide installers a pneumatically-driven alternative to hand-driven nails. The nail is approved for use in many popular Simpson Strong-Tie® products and serves as a replacement for 8d, 10d, and 16d hand-driven common nails in a variety of Simpson Strong-Tie connector applications. Available in 25-nail, paper-collated strips in both carbon steel and stainless steel.

MATERIAL: Heat-treated carbon steel, hot-dip galvanized, stainless steel

INSTALLATION: • Use all specified fasteners; see General Notes.

- Follow the manufacturer's instructions and use the appropriate safety equipment.
- Tools with nail hole-locating mechanisms should be used.
- Overdriving nails may reduce allowable loads.
- Compatible with a wide variety of popular pneumatic nailers. For more information, access our Fastener Finder software or download the Simpson Strong-Tie Fastening Systems catalog at www.strongtie.com.
- For applications involving pneumatic nails, refer to technical bulletin T-PNEUMATIC.

FASTENERS

SIMPSON

Strong-Tie

®

See our *Fastening Systems* catalog (C-F-14) for more information or access our online Fastener Finder at www.strongtie.com/fasteners.

QUICK DRIVE® AUTO-FEED SCREW DRIVING SYSTEMS

The systems offer several easy-to-use attachments bringing speed and reliability to applications that require the fastening power of screws. Our attachments provide tough, reliable performance in specific fastening applications.

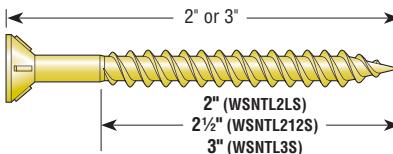

FASTENERS FOR QUIK DRIVE SYSTEMS

Featuring patented collation technology, these fasteners are designed to meet or exceed industry standards for strength and longevity while offering easy-to-load, tangle-free strips for efficient performance in auto-feed systems.

STRONG-DRIVE® FASTENERS**Strong-Drive® WSNTL SUBFLOOR Screw**

Fasteners for the Simpson Strong-Tie® Quik Drive auto-feed screw driving systems offer superior performance and reduced installation time in subfloor applications. The holding power of screws reduces the gaps that cause floor squeaks and the tool extension enables stand-up-and-drive installation.

CODES: ICC-ES ESR-1472; City of L.A. RR 25661; Florida FL 13731

**Allowable Shear (in Pounds per Foot) for Wood Structural Panel Diaphragms with Framing of Douglas Fir-Larch or Southern Pine for Wind or Seismic Loading**

		3	325	430	650	735	290	215
	19/32	2	320	421	640	730	285	215
		3	360	480	720	820	320	240

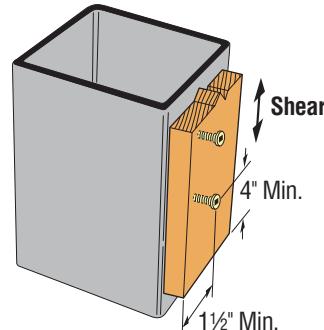

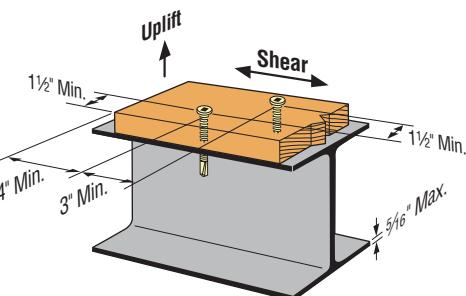

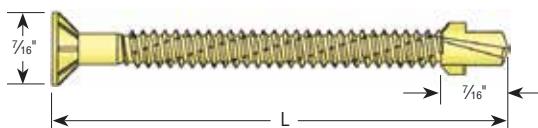

1. Minimum fastener penetration of 1 1/4" into the framing member is required.
2. For wind design, shear capacities may be increased 40% per section 2306.2.1 of the 2009 IBC and section 2306.2 of the 2012 IBC.
3. For shear loads of normal or permanent load duration as defined by the AF&PA NDS, the values in the table above must be multiplied by 0.63 or 0.56, respectively.
4. The minimum nominal width of framing members not located at boundaries or adjoining panel edges must be 2 inches.

5. Framing at adjoining panel edges must be 3 inches nominal or wider, and screws must be staggered where both of the following conditions are met:
(1) screws having penetration into framing of more than 1 1/2 inches and
(2) screws are spaced 3 inches o.c. or less.
6. Space screws maximum 12 inches o.c. along intermediate framing members (6 inches o.c. where supports are spaced 48 inches o.c.).
7. Framing at adjoining panel edges must be 3-inch nominal or wider, and screws must be staggered where screws are spaced 2 inches or 2 1/2 inches on center.
8. See ESR-1472, Table 1 for illustrations showing Cases 1 through 6.

9. See ESR-1472 for allowable shear loads for high load diaphragms.
10. WSNTL withdrawal and pull-thru values exceed those for a 10d common nail.
11. See ESR-1472 for high load diaphragm design values.

Strong-Drive® TB WOOD-TO-STEEL Screw

Simpson Strong-Tie Quik Drive auto-feed systems with TB series screw strips are a fast and reliable way to fasten wood to steel members. Available in loose and collated options. They are self-drilling so no predrilling is required.

**TB – Allowable Loads – DF and SP Lumber Attachment to Steel (Steel Members 16 ga -5/16" Thick)**

Model No.	Length in. (mm)	Nominal Wood Thickness	Steel Thickness mil (ga)	DF/SP Allowable Load			
				Uplift		Shear

			C _D =1.6	225	225	210	335
			97-312 (12 - 5/16")	245	390	215	345
			54 (16)	195	195	210	335
			68 (14)	225	225	210	335
			97-312 (12 - 5/16")	245	390	215	345
TB1475S	3" (75)		54 (16)	195	195	210	335
			68 (14)	225	225	210	335
			97-312 (12 - 5/16")	245	390	215	345

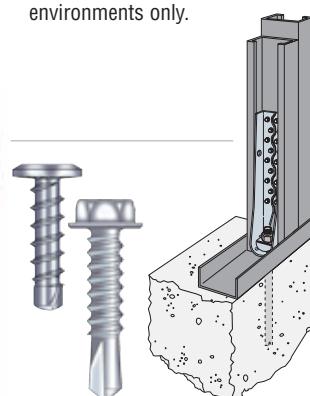

1. For use with structural steel members up to 5/16" thick or cold-formed steel members 54 mil (16 ga.) or thicker.
2. Standard product available in a black phosphate, yellow zinc or N2000 coating for additional corrosion protection (TBG1460S or TBG1475S).
3. For use with 2x (1 1/2") DF/SP only.
4. For use with Quik Drive HSD60 or HSD75 Tool.
5. Use increased allowable loads (C_D = 1.6) only when resisting wind or seismic forces.

WARNING: Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Accordingly, use this product in dry, interior, and noncorrosive environments only.

Designing with Steel?

If you are designing a structure using Cold-Formed Steel, comprehensive design information on using connectors, Simpson Strong-Tie anchoring products and Quik Drive® screws in your project can be found in the latest issue of the Simpson Strong-Tie *Cold-Formed Steel Connectors* catalog. You can access this information via the web at www.strongtie.com.

Have you tried our new Simpson Strong-Tie® CFS Designer™ software? It gives cold-formed steel (CFS) Designers the ability to design CFS beam-column members according to AISI specifications and to analyze complex beam loading and span conditions. To learn more, visit www.strongtie.com.

STRONG-DRIVE® SDS HEAVY-DUTY CONNECTOR Screw

The Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screw is a $\frac{1}{4}$ " diameter structural wood screw ideal for various connector installations as well as wood-to-wood applications. It installs with no predrilling and has been extensively tested in various applications. The SDS Heavy-Duty Connector screw is improved with a patented easy driving 4CUT™ point and a corrosion resistant double-barrier coating.

The #8x $\frac{1}{4}$ " SD Wafer-Head screw is ideal for miscellaneous fastening applications. The needle point ensures fast starts and deep #2 Phillips drive reduces cam-out and stripping.

SDS FEATURES:

- The patented 4CUT point has a square core and serrated threads to reduce installation torque and make driving easier with no predrilling and minimal wood splitting.
- Available with a double-barrier coating or in Type 316 stainless steel. Carbon steel loads apply to corresponding stainless steel models.**
- $\frac{3}{8}$ " hex washer head is stamped with the No-Equal sign and fastener length for easy identification after installation.

MATERIAL: Heat-treated carbon steel, Type 316 stainless steel

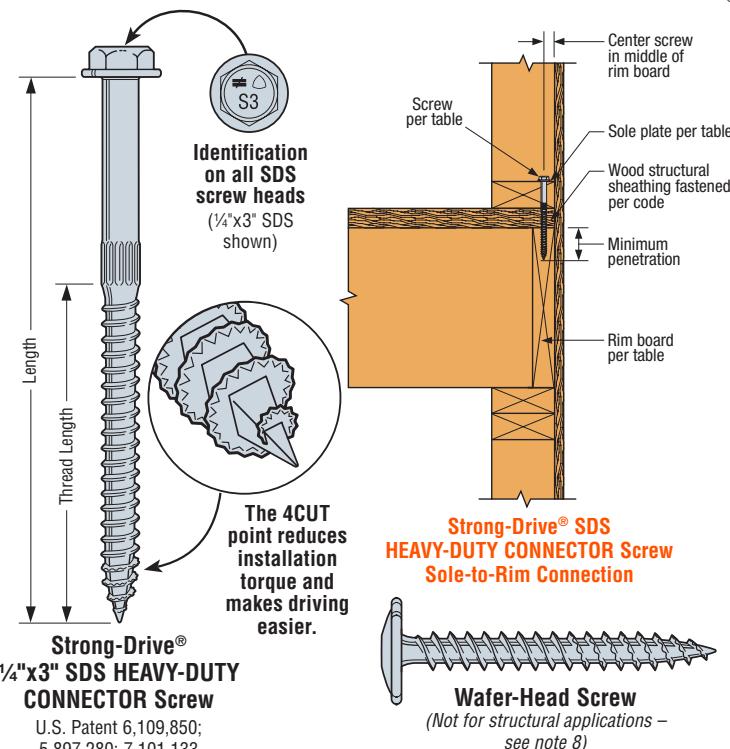

FINISH: SD8x1.25—Electro Galvanized;

SDS—Double Barrier (all lengths);

SDS—Type 316 Stainless Steel ($1\frac{1}{2}$ " thru $3\frac{1}{2}$ " lengths)

CODES: See page 12 for Code Reference Key Chart.

WARNING: Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Accordingly, the SD8x1.25 should be used in dry, interior, and noncorrosive environments only.

► These products feature additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Screws may be provided with the 4CUT or Type 17 point.
2. Strong-Drive® SDS Heavy-Duty Connector screws install best with a low speed $\frac{1}{2}$ " drill with a $\frac{3}{8}$ " hex head driver.
3. Values are valid for connections between two members with full thread penetration into the main member. For other wood side plate values, see *Fastening Systems catalog (C-F-14)* pages 317-321.
4. Allowable loads are shown at the wood load duration factor of $C_D=1.00$. Loads may be increased for load duration per the building code up to a $C_D=1.60$.
5. Withdrawal loads shown are in pounds (lbs.) and are based on the entire threaded section installed into the main member. If thread penetration into the main member is less than the Thread Length as shown in the table, reduce allowable load by 172 lbs. x inches of thread not in main member. Use 121 lbs./inch for SPF.

6. Fasteners per Carton represent the quantity of screws that are available in bulk packaging. Screws are also available in mini bulk and retail packs. Refer to Simpson Strong-Tie® *Fastening Systems catalog (C-F-14)*.
7. LSL wood-to-wood applications that require $4\frac{1}{2}$ ", 5", 6" or 8" SDS screws are limited to interior-dry use only.
8. SD8x1.25 requires $\frac{3}{8}$ " minimum penetration. DO NOT USE SD8x1.25 wood screws with structural connectors unless specified and stated in this catalog.
9. Where predrilling is required for Strong-Drive® SDS Heavy-Duty Connector screws, predrill diameter is $\frac{5}{32}$ ".
10. Minimum spacing, edge, and end distance requirements are listed in ICC-ES ESR-2236. For smaller requirements, please contact Simpson Strong-Tie engineering.

STRONG-DRIVE® SD CONNECTOR Screw

Simpson Strong-Tie offers the Strong-Drive® SD Connector screw for use with our connectors. Designed to replace nails in certain products, the load-rated Strong-Drive® SD Connector screw has been tested and approved for use in many popular Simpson Strong-Tie® connectors. In certain applications screws are easier and more convenient to install than nails, and the single-fastener load values achieved by the SD9 and SD10 exceed those of typical 10d common or 16d common nails, respectively. In addition, the galvanized coating makes the Strong-Drive® SD Connector screw ideal for interior and most exterior conditions.

The Strong-Drive® SD Connector screw features an optimized shank, specifically designed for capability with the fastener holes in Simpson Strong-Tie connectors. The hex head virtually eliminates cam-out and helps avoid stripping of the head during installation. The sharp point of the screw enables fast starts, and the patented serrated threads reduce torque for improved drivability.

FEATURES:

- Tested and approved for use in many of our best-selling connectors for both interior and most exterior applications
- The single-fastener steel-side-plate load capacity of the SD9 exceeds the capacity of a 10d common nail, while the single-fastener load capacity of the SD10 exceeds that of the 16d common nail
- Ideal for use in tight spaces where using a hammer is inconvenient
- Optimized heat-treating for ductility and strength
- Mechanically galvanized coating meets ASTM B695 Class 55, is recommended for use with certain preservative-treated woods and recognized as an alternate to hot-dip galvanized in ESR-3046. It is compliant with the 2006, 2009, and 2012 International Residential Code® (2006 Section R319.3, 2009 and 2012 Section R317.3.1)
- 1/4" hex drive included
- Head identification

MATERIAL: Heat-treated carbon steel

FINISH: Mechanically galvanized (ASTM Class 55)

CODES: See page 12 for Code Reference Key Chart.

► These products feature additional corrosion protection.

Since testing of the Strong-Drive® SD Connector screw is ongoing, Simpson Strong-Tie continues to add connectors to the approved-connector list. For the most current list of approved connectors, load values and applications, visit www.strongtie.com/strongdrive.

Simpson Strong-Tie has evaluation report approval for most of our Strong-Drive® SD Connector screws. Check with your local building department to determine whether the correct size of Strong-Drive® SD Connector screw may be used as a suitable substitute for nails.

1. Withdrawal loads and steel-side-plate shear loads are based on testing per AC233.
2. Allowable loads are shown at the wood load duration factor of $C_D = 1.00$. Loads may be increased for load duration per the building code up to a $C_D = 1.60$.
3. Withdrawal loads are based on the entire threaded section installed into the main member.
4. Visit www.strongtie.com for wood-to-wood shear values and wood-side-plate details.

UFP Universal Foundation Plate

The UFP provides a retrofit method to anchor the mudsill to the side of the foundation in applications where minimum vertical clearance exists. The UFP is also designed to perform when the mudsill is offset from the foundation up to $2\frac{1}{2}$ " or extended beyond the foundation up to $\frac{1}{2}$ ".

The UFP may be used in place of the FA, HFA and FAP connectors.

MATERIAL: 14 gauge

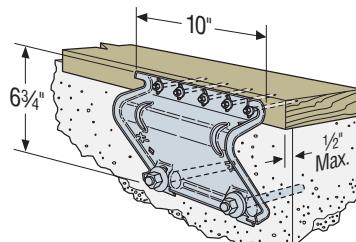

FINISH: Galvanized. May be ordered HDG, contact Simpson Strong-Tie. See Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners; see General Notes.

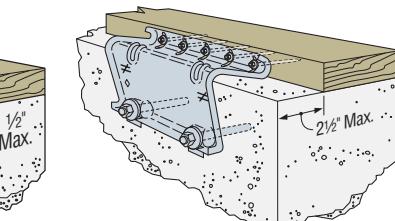

- Loads are based on test results using Simpson Strong-Tie® Strong-Drive® $\frac{1}{4}$ "x3" SDS Heavy-Duty Connector screws, which are supplied with the UFP10.
- Alternate lag screws will not achieve published loads.

CODES: See page 12 for Code Reference Key Chart.

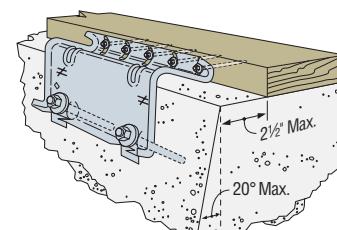

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

UFP10 installed
on a Straight Foundation

Model No.	Max Spacing to replace Anchor Bolt $\frac{1}{2}$ " or $\frac{5}{8}$ " dia.	Fasteners		Allowable Load DF/SP Parallel to Plate (160)	Code Ref.
		Anchor Bolt Qty.	Plate Dia.		
UFP10-SDS3	6'	2	$\frac{1}{4}$	5-SDS $\frac{1}{4}$ "x3"	I20, L10, F19

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other load durations apply.
2. Each anchor bolt requires a standard cut washer, see technical bulletin T-ANCHORSPEC for more information.
3. Designer must specify anchor bolt type, length and embedment.

FAP/FJA/FSA Foundation Anchors

The FAP Plate connects the mudsill to the foundation, and is designed to provide lateral load resistance.

The FJA Foundation Joist Anchor nails or bolts directly into floor joists, providing a direct connection between the foundation and joist to resist uplift and lateral forces. FSA Foundation Stud Anchor nails or bolts to floor joists, or nails to the stud. Plywood sheathing may require notching with stud-to-foundation installation. See technical bulletin T-ANCHORSPEC for anchoring solutions.

MATERIAL: FAP—7 gauge; all others—12 gauge

FINISH: Galvanized. May be ordered HDG, contact Simpson Strong-Tie. See Corrosion Information, pages 13-15.

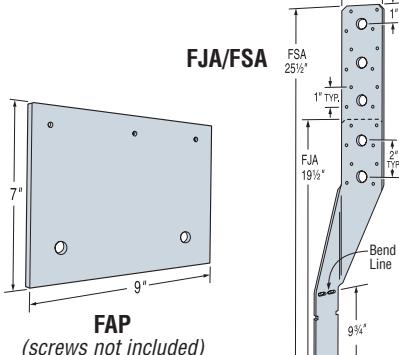

INSTALLATION:

- Use all specified fasteners; see General Notes.
- **FJA** and **FSA** may be bent along bend line up to 20° to accommodate installation. Bend one time only.

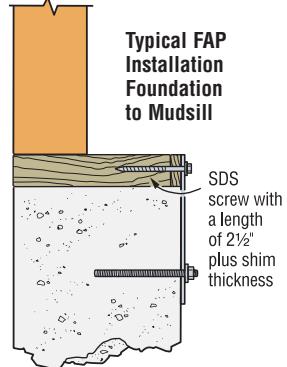

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Max Spacing to Replace Anchor Bolts		Fasteners		Allowable Loads DF/SP			Code Ref.

					2- $\frac{1}{2}$ MB	690	—	—	

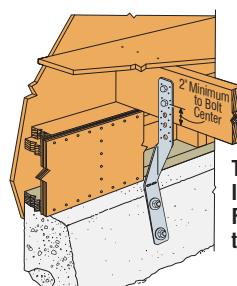

FAP
(screws not included)

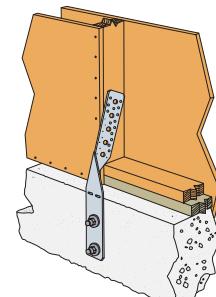

Typical FAP Installation Foundation to Mudsill

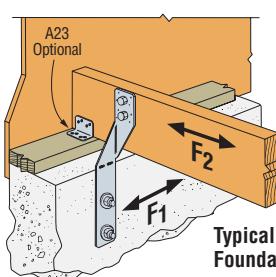

Add a shim between plate and sill when space is between $\frac{3}{16}$ " and $1\frac{1}{2}$ ". When space exceeds $1\frac{1}{2}$ " use the UFP. The shim must be fastened to the mudsill by means other than the FAP SDS wood screw.

Typical FJA Installation Foundation to Joist

Typical FSA Installation Foundation to Stud

Typical FSA Installation Foundation to Stud

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other load durations govern.
2. For redwood mudsills, reduce F₁ on FAP to 840 lbs.
3. Spacing to be specified by the Designer.
4. FAP shall use a minimum Strong-Drive® SDS Heavy-Duty Connector screw length of $2\frac{1}{2}$ " plus the shim thickness.
5. The shim must be fastened to the mudsill by means other than the FAP Strong-Drive® SDS Heavy-Duty Connector screw.
6. FAP may be installed with $\frac{1}{4}$ " HDG lag bolts. Follow code requirements for predrilling.
7. **NAILS:** $10dx1\frac{1}{2}$ = 0.148 " dia. x $1\frac{1}{2}$ " long. See pages 22-23 for other nail sizes and information.

MASA/MASAP Mudsill Anchors

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

Mudsill anchors have always been a time-saving alternative to anchor bolts, and the MASA anchors provide even greater load-carrying capacity alternative for $\frac{5}{8}$ " and $\frac{1}{2}$ " mudsill anchor bolts on 2x, double-2x and 3x mudsills. It also eliminates the need for 3" square plate washers for seismic design and, in some cases, has load capacities that meet or exceed the parallel and perpendicular to plate shear capacity of other cast-in-place anchors. Two versions of the MASA are available – the standard MASA for installation on standard forms and the MASAP for panelized forms.

The MASA and MASAP are code listed by ICC-ES under the 2006, 2009 and 2012 IBC® and IRC® and have been tested to meet the requirements of ICC-ES acceptance criteria AC-398 for cracked and uncracked concrete.

MATERIAL: 16 gauge

FINISH: Galvanized, all available in ZMAX® coating.

See Corrosion Information, pages 13-15.

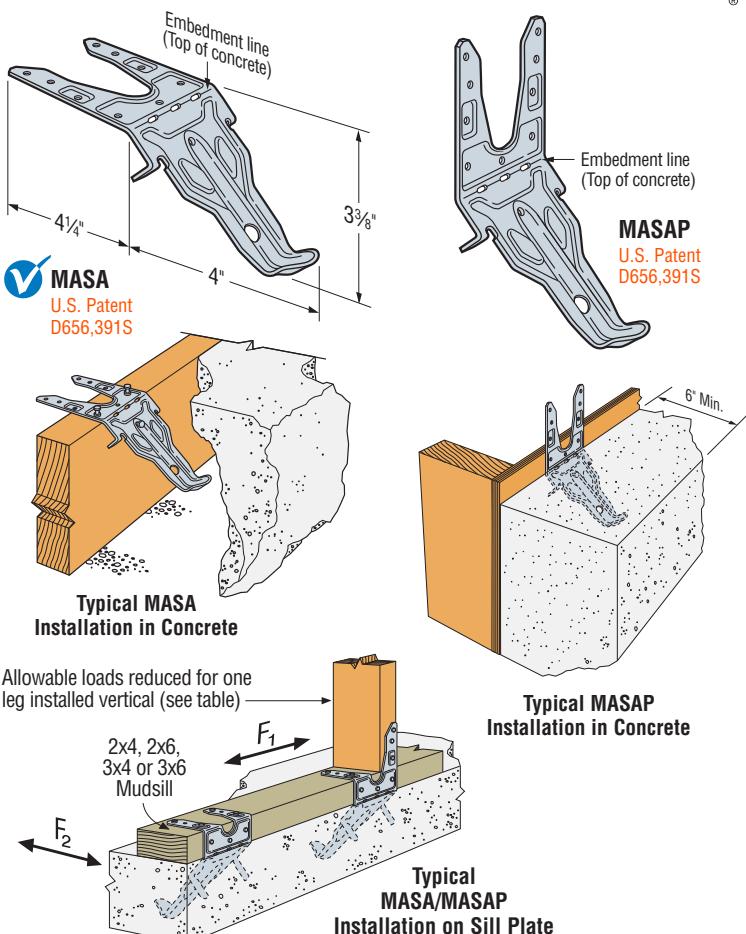

INSTALLATION: • Use all specified fasteners. See General Notes.

• MASA/MASAP

- Concrete shall have a minimum $f'_c = 2500$ psi.
- Spalling—Full loads apply for spalls up to a maximum height of $1\frac{1}{4}$ " and a maximum depth of $\frac{1}{8}$ ". Any exposed portion of the mudsill anchor must be protected against possible corrosion.
- For prescriptive anchor spacing refer to page 30.
- Testing shows that these mudsill anchors can be used in lieu of code required anchor bolts and square washer in high seismic zones. Refer to flier F-MASA for additional information.
- Minimum MASA end distance is 4" and minimum center-to-center spacing is 8" for full load.
- For continuous load path, MASA should be installed on the same side of wall as uplift connectors.

CODES: See page 12 for Code Reference Key Chart.

ICC-ES ESR-2555, City of L.A. RR 25851; Florida FL13326

1. Loads are based on allowable stress design (ASD) and include the load duration factor C_D (with $C_D = 1.6$) for wind/earthquake loading. No further increase is allowed. Reduce where other loads govern.
2. Minimum concrete compression strength, f'_c is 2500 psi.
3. Allowable loads are based on a minimum stemwall width of 6".
4. For simultaneous loads in more than one direction, the connector must be evaluated using the Unity Equation.

5. Per Section 1613 of the 2009 and 2012 IBC, detached one- and two-family dwellings in SDC C may use the "Wind and SDC A&B" allowable loads.
6. For designs under the 2009 and 2012 IBC, sill plate size shall comply with the shearwall requirements of the 2008 Special Design Provisions for Wind and Seismic.
7. MASA/MASAP may be installed using 7-nails when being used to replace a $\frac{1}{2}$ " diameter sill bolt for use on a 2x mudsill. **Install minimum 3-side fasteners.**
8. **NAILS:** $10dx1\frac{1}{2} = 0.148$ dia. x $1\frac{1}{2}$ " long. See pages 22-23 for other nail sizes and information.

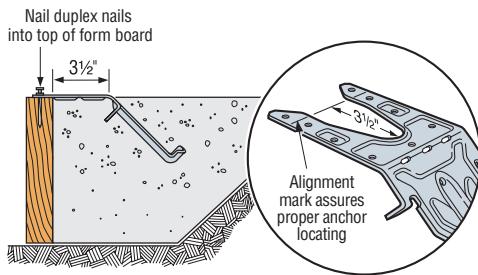

Prescriptive Spacing for MASA/MASAP to Replace Sill Anchor Bolts

Anchor Bolt Size	Anchor Bolt Spacing	DF/SP 2x Sill Plate		HF 2x Sill Plate	
		Wind & SDC A&B	SDC C - E	Wind & SDC A&B	SDC C - E
$\frac{1}{2}$ " Diameter	6' o.c.	6'-0"	6'-0"	6'-0"	6'-0"
	4' o.c.	4'-0"	4'-0"	4'-0"	4'-0"
$\frac{5}{8}$ " Diameter	6' o.c.	5'-7"	4'-7"	5'-4"	4'-4"
	4' o.c.	3'-9"	3'-1"	3'-6"	2'-11"

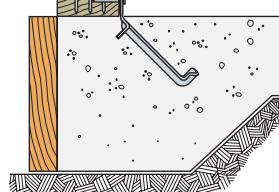

1. "Prescriptive" denotes designs per the IBC or conventional provisions of the IBC for wind speeds 100 mph or less, or for Seismic Design Category D and less (SDC E and less in IBC).
2. Detached one- and two-family dwellings in SDC C may use the "Wind & SDC A&B" spacing.
3. Spacing is based on the parallel to plate load direction for MASA Standard installation only.
4. $\frac{5}{8}$ " diameter AB required in SDC E.
5. When replacing $\frac{1}{2}$ " diameter sill bolts use 7-10dx1 $\frac{1}{2}$ " nails for standard installation. 1 out of 3 MASAs (33%) may be installed in One Leg Up installation along a wall line.
6. When replacing $\frac{5}{8}$ " diameter sill bolts use 9-10dx1 $\frac{1}{2}$ " nails for standard installation. 1 out of 5 MASAs (20%) may be installed in One Leg Up installation along a wall line.
7. Per Section 1613 of the 2009/2012 IBC, detached one- and two-family dwellings in SDC C may use the "Wind & SDC A&B" spacing.

ALTERNATIVE MUDSILL ANCHOR INSTALLATIONS**ALTERNATE INSTALLATION FOR INSIDE OF WALL CONTINUITY**

Full catalog loads apply.

**1** STEP 1:

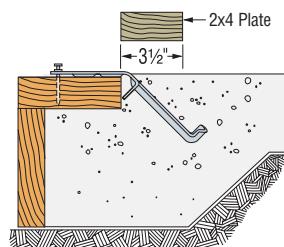

Attach MASA 3 1/2" from inside of form.
After concrete cures, remove nails and bend straps up 90°

**2** STEP 2:

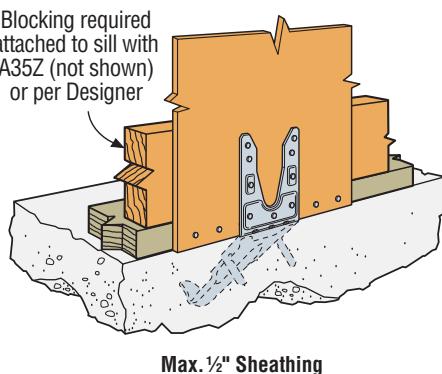

Place mudsill on concrete
and nail MASA over mudsill

ALTERNATE INSTALLATION FOR BRICK LEDGES

Full catalog loads apply.

Alternate MASA Installation for Brick Ledges

ALTERNATE INSTALLATION FOR RIM JOIST OR BLOCKING

Mudsill anchors provide an alternative to anchor bolts. They easily mount on forms and make finishing easier. The unique design provides installation flexibility, eliminating problems with misplaced anchor bolts. Suitable for stem wall or slab foundations, mudsill anchors are one piece so there are no more nuts and washers to lose.

LMAZ—an economical replacement for $\frac{1}{2}$ " sill plate anchor bolts
MA—for slab or stem wall construction

MAB—anchors mudsill to concrete block, poured walls or slab foundations

MATERIAL: LMAZ, MAB—18 gauge; MA/MASB—16 gauge
FINISH: MA, MAB, MASB—Galvanized (*some available in ZMAX® coating*) LMAZ—ZMAX only. See Corrosion Information, page 12-15.

INSTALLATION: • Use all specified fasteners. See General Notes pages 13-15.

- **LMAZ/MAZ/MAB:**
 - CMU shall have a minimum $f'm = 1500$ psi and concrete shall have a minimum $f'c = 2000$ psi.
 - Not for use where a horizontal cold joint exists between the slab and foundation wall or footing beneath, unless provisions are made to transfer the load.
 - Not for use in slabs poured over foundation walls formed of concrete block or with brick and 4" masonry block stemwalls.
 - **MASB:**
 - Fill CMU cell with concrete grout first, then place MASB into the grouted cell and adjust into position. Attach mudsill to anchor only after the concrete grout cures.
 - CMU shall have a minimum $f'm = 1500$ psi.
 - The MASB Mudsill Anchors were tested in standard 8" CMU.

CODES: See page 12 for Code Reference Key Chart

 These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Loads have been increased for short-term loading.
 2. For uplift loads, provide attachment from mudsill to building's structural components to prevent cross-grain bending.
 3. MA installed attached to the stud has no load reduction for parallel loads, has a perpendicular load of 670 lbs. and an uplift of 835 lbs.
 4. LMAZ installed attached to the stud has no load reduction for parallel and perpendicular loads and an uplift of 600 lbs. for LMA4 and 835 lbs. for LMA6.
 5. For concrete stemwall applications, allowable loads are based on a minimum concrete stemwall width of 6".
 6. **NAUL S:** 10d x 1½" = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

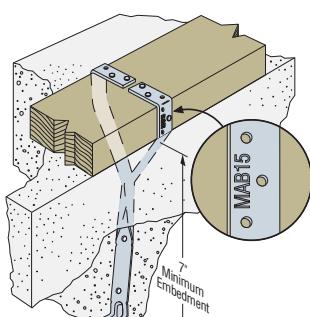

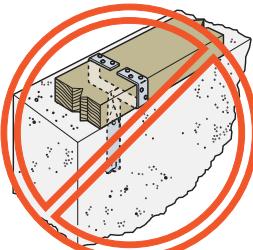

Prescriptive Anchor Spacing

Model No.	O.C. Spacing To Replace $\frac{1}{2}''$ Anchor Bolt 6' O.C. (160)	O.C. Spacing To Replace $\frac{5}{8}''$ Anchor Bolt 6' O.C. (160)	Minimum Concrete End Distance	Minimum C-C Spacing

FWAZ/FWANZ Foundation Wall Angle**SIMPSON****Strong-Tie**

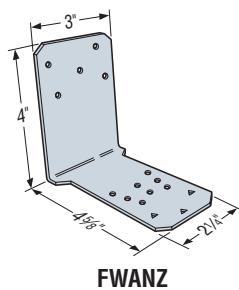

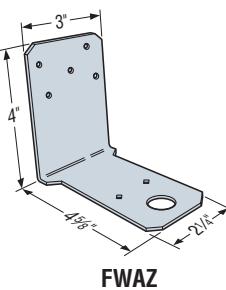

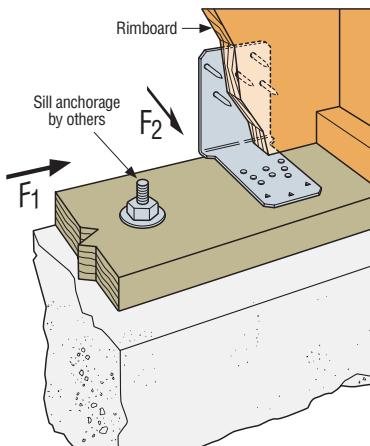

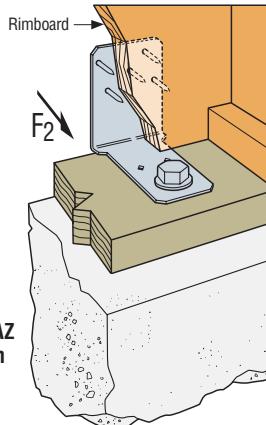

FWA foundation anchors connect the foundation or basement walls to the floor system to resist out-of-plane forces imposed by soil pressure. The FWAZ attaches through the mudsill into the foundation using the Simpson Strong-Tie® Titen HD® heavy-duty screw anchor, eliminating the need for separate anchor bolts into the rim joist. The FWANZ fastens to the mudsill with nails, relying on other anchorage (by Designer) to anchor the rim joist to the foundation. The spacing of the FWA anchors is independent of the joist spacing, allowing for a multitude of options based on soil pressures.

Special Features:

- Compatible with solid sawn joists, I-joists and floor trusses.
- Testing performed on most common rim materials and types.
- Addresses design needs set forth in Section 1610.1 in the IBC and Section R404 in the IRC.
- Eliminates the need of costly cantilevered foundation designs.

MATERIAL: 14 gauge**FINISH:** ZMAX® coating. See Corrosion Information, pages 13-15.**INSTALLATION:** • Use all specified fasteners. See General Notes.

- Connectors must be fastened directly to the outside face of the rim board with 5-10dx1½ (0.148" dia. x 1½") long nails.
- Connectors must be located within 4" of adjacent joist/blocking for floor joist spacing up to 48" o.c. and may be centered between joists/blocking for 16" o.c. floor joist spacing.
- When floor joists are parallel to the rim board, full depth blocking shall be used in the first two bays of the floor per 2006 IRC Section R404.1.
- Splice joint not permitted on rim board in same bay unless blocking is placed on both sides of the splice. The maximum sill plate thickness to be used for the FWAZ only shall be 1½".
- FWAZ only—must be anchored to the foundation wall with ½"x6" mechanically galvanized Titen HD heavy-duty screw anchor (*included*).
- Cast-in-place anchor bolts may not be used as a substitute.
- When I-joist rim material is used, backer blocks must be used. Installed per manufacturer's recommendations.

CODES: See page 12 for Code Reference Key Chart. Refer to IBC 1610.1.**FWANZ****FWAZ****Typical FWANZ Installation****Typical FWAZ Installation**

				1¾" LVL Rim	880	1055	1280		

1. Lateral (F₂) loads are based on load duration factor C_D = 0.90 with no further increase allowed.
2. FWAZ spacing shall be per Designer.
3. FWAZ must be located within 4" of adjacent joist/blocking for floor joist spacing up to 48" o.c. and may be centered between joists/blocking for 16" o.c. floor joist spacing.
4. Maximum sill plate thickness shall be 1½".
5. The Titen HD heavy-duty screw anchor used in the FWAZ to resist the out-of-plane (F₂) forces may also be used to resist in-plane shear forces provided the Designer determines the Titen HD heavy-duty screw anchor allowable loads (*refer to C-SAS catalog*) and evaluates the combined loading condition with the published F₂ loads.
6. **NAILS:** 10dx1½ = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

1. FWANZ may be used to transfer F₁ loads up to 310 lbs. No further increase in load permitted.
2. For simultaneous F₁ and F₂ loads, the connector must be evaluated using the unity equation (*see page 18*).
3. Designer shall evaluate rim board and sill plate design based on demand load.
4. FWANZ spacing and sill plate anchorage to be specified by the Designer.
5. FWANZ must be located within 4" of adjacent joist/blocking for floor joist spacing up to 48" o.c. and may be centered between joists/blocking for 16" o.c. floor joist spacing.
6. When floor joists are parallel to the rimboard, Designer must ensure proper load transfer from rimboard into diaphragm.
7. Values based on a load duration factor C_D = 0.90.
8. **NAILS:** 10dx1½ = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

SB Anchor Bolt

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The SB $\frac{5}{8}$ x24 anchor bolt offers a load-tested anchorage solution that exceeds the capacity of all of our holdowns that call for a $\frac{5}{8}$ " dia. anchor. Similarly, the SB1x30 covers holdowns utilizing a 1" diameter anchor that exceed the capacity of our SSTB bolts. The SB $\frac{5}{8}$ x24 is designed to maximize performance with minimum embedment for holddowns utilizing a $\frac{7}{8}$ " dia. anchor.

SB anchor bolts are code listed by ICC-ES under the 2009 and 2012 IBC and IRC to meet the requirements of ICC-ES acceptance criteria – AC 399. ICC-ES ESR-2611 is the industry's first code report issued for proprietary anchor bolts evaluated to the criteria of AC 399.

Special Features:

- Indentification on the bolt head showing embedment angle and model
- Sweep geometry to optimize position in form
- Rolled thread for higher tensile capacity
- Hex nuts and plate washer fixed in position
- Available in HDG for additional corrosion resistance

MATERIAL: ASTM F-1554, Grade 36

FINISH: None. May be ordered HDG. Contact Simpson Strong-Tie.

INSTALLATION:

- SB is only for concrete applications poured monolithically except where noted.
- Top nuts and washers for holdown attachment are not supplied with the SB; install standard nuts, couplers and/or washers as required.
- On HDG SB anchors, chase the threads to use standard nuts or couplers or use overtapped products in accordance with ASTM A563, for example Simpson Strong-Tie® NUT5/8-OST, NUT7/8-OST and NUT1-OST, CNW $\frac{5}{8}$ -OST, CNW $\frac{7}{8}$ -OST and CNW1-OST.
- Install SB before the concrete pour using AnchorMates®. Install the SB per the plan view detail.
- Minimum concrete compressive strength is 2500 psi.
- When rebar is required it does not need to be tied to the SB.

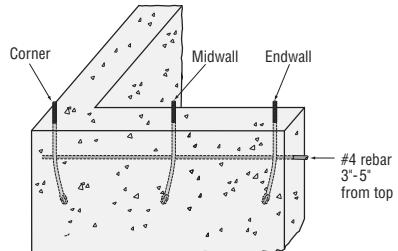

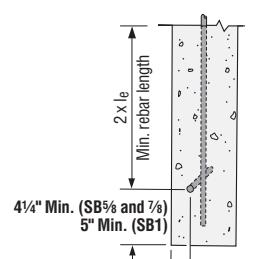

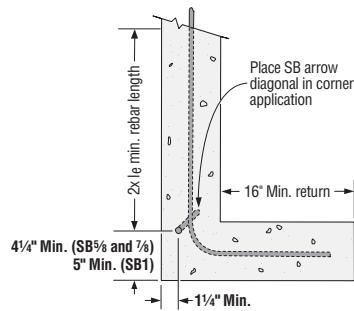

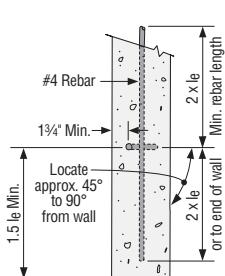

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

**Notes to the Designer:**

1. Rebar is required at top of stemwall foundations but is not required for Slab-on-Grade Edge and Garage Curb, or Stemwall Garage Front installations.
2. Minimum end distances for SB bolts are as shown in graphics.
3. Multiply the tabulated ASD wind or seismic loads by 1.6 or 1.4, respectively, to obtain LRFD capacities.
4. Per Section 1613 of the IBC, detached one- and two-story dwellings in SDC C may use "Wind and SDC A&B" allowable loads.
5. See ESR-2611 for additional information.
6. Midwall loads apply when anchor is 1.5 le or greater from the end. For bolts acting in tension simultaneously, the minimum bolt center-to-center spacing is 3 le.
7. Full catalog loads apply for two-pour installation for slab-on-grade: edge.

SSTB® Anchor Bolts

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The SSTB anchor bolt is designed for maximum performance as an anchor bolt for holdowns and Simpson Strong-Tie® Strong-Wall® shearwalls. Extensive testing has been done to determine the design load capacity of the SSTB when installed in many common applications.

The Simpson Strong-Tie® SSTB anchor bolts are now code listed by ICC-ES under the 2009 and 2012 IBC® and IRC® to meet the requirements of ICC-ES acceptance criteria AC 399. ICC-ES ESR-2611 is the industry's first code report issued for proprietary anchor bolts evaluated to the criteria of AC 399.

Special Features:

- Identification on the bolt head showing embedment angle and model
- Offset angle reduces side bursting, and provides more concrete cover
- Rolled thread for higher tensile capacity
- Stamped embedment line aids installation
- Available in HDG for additional corrosion resistance

MATERIAL: ASTM F-1554, Grade 36

FINISH: None. May be ordered HDG; contact Simpson Strong-Tie.

INSTALLATION:

- SSTB is suitable for monolithic and two-pour concrete applications.
- Nuts and washers for holdown attachment are not supplied with the SSTB; install standard nuts, couplers and/or washers as required.
- On HDG SSTB anchors, chase the threads to use standard nuts or couplers or use overtapped products in accordance with ASTM A563, for example Simpson Strong-Tie® NUT $\frac{1}{8}$ -OST, NUT $\frac{1}{8}$ -OST, CNW $\frac{1}{8}$ -OST, CNW $\frac{1}{8}$ -OST.
- Install SSTB before the concrete pour using AnchorMates®. Install the SSTB per the plan view detail.
- Minimum concrete compressive strength is 2500 psi.
- When rebar is required it does not need to be tied to the SSTB.
- Order SSTBL Models (example: SSTB16L) for longer thread length (16L = 5 $\frac{1}{2}$ ", 20L = 6 $\frac{1}{2}$ ", 24L = 6", 28L = 6 $\frac{1}{2}$ "). SSTB and SSTBL load values are the same. SSTB34 and SSTB36 feature 4 $\frac{1}{2}$ " and 6 $\frac{1}{2}$ " of thread respectively and are not available in "L" versions.

CMU

- One horizontal #4 rebar in the second course.
- One vertical #4 rebar in adjacent cell for $\frac{5}{8}$ " diameter SSTB.
- One vertical #4 rebar in an adjacent cell and additional vertical #4 rebar(s) at 24" o.c. max. for $\frac{7}{8}$ " diameter SSTBs (2 total vertical rebars for end wall corner, 3 total vertical rebars for midwall).

CODES: See page 12 for Code Reference Key Chart.

 These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

SSTB Bolts at Stemwall

Two Pour Installation
(SSTB20, 24, 34 and 36)

For two-pour (4" slab) installation loads:

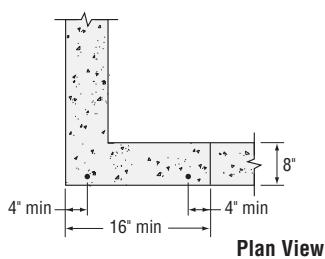

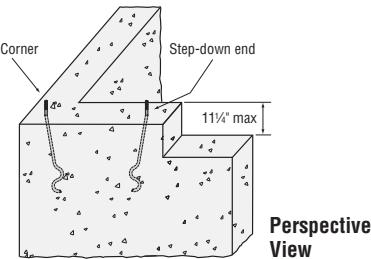

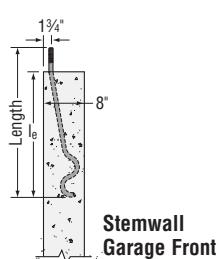

- When using the SSTB20, use the equivalent loads of the SSTB16.
- When using the SSTB24, use the equivalent loads of the SSTB20.
- When using the SSTB34 or 36, use the equivalent loads of the SSTB28.

SSTB28	6	7/8	29 7/8	24 7/8	10085	12375	8475	10395	I23	

Notes to the Designer:

1. Rebar is required at top of stemwall foundations but is not required for Slab-on-Grade Edge and Garage Curb, or Stemwall Garage Front installations.
2. Minimum end distances for SSTB bolts are as shown in graphics.
3. Multiply the tabulated ASD wind or seismic loads by 1.6 or 1.4, respectively, to obtain LRFD capacities.
4. Per Section 1613 of the IBC, detached one- and two-story dwellings in SDC C may use "Wind and SDC A&B" allowable loads.
5. See ESR-2611 for additional information.
6. Midwall loads apply when anchor is 1.5 le or greater from the end. For bolts acting in tension simultaneously, the minimum bolt center-to-center spacing is 3 le.

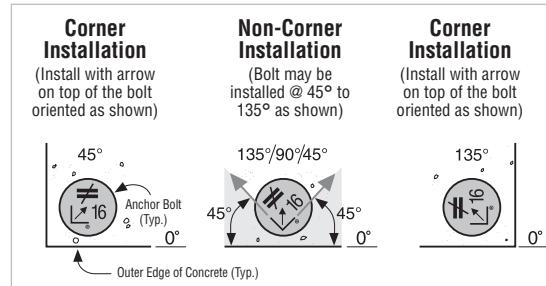

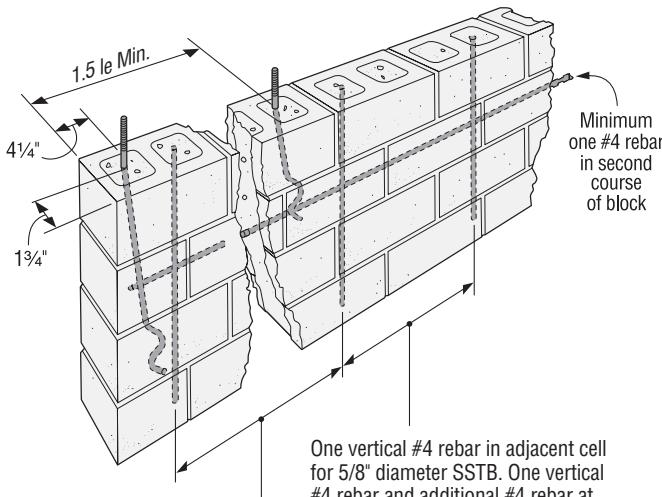

SSTB® Anchor Bolts

Typical SSTB Installation in Concrete Foundation
Maintain minimum rebar cover, per ACI-318 concrete code requirements

SSTB Bolts in 8" CMU

Model No.	Dia. (in.)	Length (in.)	Min. Embed. (l _e)	Allowable Tension Load		Code Ref.
				Midwall	Corner/End Wall	
SSTB16	5/8	17 1/8 (16L = 19 1/8)	12 1/8	4780	1850	170
SSTB20	5/8	21 1/8 (20L = 24 1/8)		4780	1850	
SSTB24	5/8	25 1/8 (24L = 28 1/8)		4780	1850	
SSTB28	7/8	29 1/8 (28L = 32 1/8)		6385	4815	
SSTB34	7/8	34 1/8		6385	4815	
SSTB36	7/8	36 1/8		6385	4815	

1. Loads are based on a minimum CMU compressive strength, f_m , of 1500 psi.
2. Minimum end distance required to achieve midwall table loads is 1.5 l_e.
3. Minimum end distance for corner/end wall loads is 4 1/4".
4. Loads may not be increased for duration of load.

**Plan View of SSTB Placement in Concrete**

Typical SSTB Installation in Grouted Concrete Block

One vertical #4 rebar in adjacent cell for 5/8" diameter SSTB. One vertical #4 rebar and additional #4 rebar at 24" o.c. max. for 7/8" diameter SSTB.
(2 total vertical rebars for endwall,
3 total vertical rebars for midwall)

GH Girder Hangers

A girder-to-foundation wall connection.

MATERIAL: 12 gauge

FINISH: Simpson Strong-Tie® gray paint, hot-dip galvanized, specify HDG.

See Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

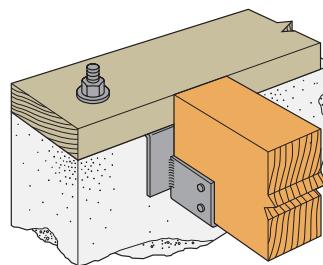

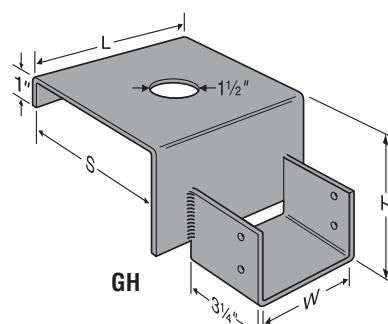

- Insert four 16d commons into girder.
- H = girder height – mudsill thickness. **Measurement is top of steel to top of steel.**
- 1 1/2" clearance hole accommodates rebar or anchor. This is not required.

OPTIONS: • GH hangers may be skewed to a maximum of 45° with no load reduction; bevel cut required.
• Specify GHD for saddle-style hangers. GHD may not be skewed.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Girder	Dimensions (in.)					Fasteners	Allowable Loads		Code Ref.
		W	L	H 2x Plate	H 3x Plate	S		Floor (100)	Roof (125)

GH68-6	6x8	5 1/2	8	5 1/4	4 1/4	6 1/16	4-16d	4000	4000	
GH68-8	6x8	5 1/2	8	5 1/4	4 1/4	8 1/16	4-16d	4000	4000	
GH610-6	6x10	5 1/2	8	7 1/4	6 1/4	6 1/16	4-16d	4000	4000	
GH610-8	6x10	5 1/2	8	7 1/4	6 1/4	8 1/16	4-16d	4000	4000	

1. Loads may not be increased for short-term loading.
2. A mudsill on top of the GH is required to achieve the table loads.
3. Models listed are for a 2x plate, specify "H" dimension when ordering for use with a 3x plate.
4. Uplift loads do not apply for this hanger.
5. **NAILS:** 16d = 0.162" dia. x 3 1/2" long. See pages 22-23 for other nail sizes and information.

**Typical GH Installation**

PAB Pre-Assembled Anchor Bolt

The PAB anchor bolt is a versatile cast-in-place anchor bolt ideal for high-tension-load applications, such as rod systems and shearwalls. It features a plate washer at the embedded end sandwiched between two fixed hex nuts and a head stamp for easy identification after the pour.

- Available in diameters from $\frac{1}{2}$ " to $1\frac{1}{4}$ " in lengths from 12" to 36" (in 6" increments)
- Available in standard and high-strength steel
- Head stamp contains the No Equal sign, diameter designation and an "H" on high-strength rods

MATERIAL: Standard Steel – ASTM F1554 Grade 36, A36 or A307 – $F_u = 58$ ksi

High-Strength Steel (up to 1" dia.) – ASTM A449 – $F_u = 120$ ksi

High-Strength Steel ($1\frac{1}{8}$ " and $1\frac{1}{4}$ " dia.) – ASTM A193 B7 or F1554 Grade 105 – $F_u = 125$ ksi

FINISH: None

The Simpson Strong-Tie® Anchor Designer™ Software analyzes and suggests anchor solutions using the ACI 318 Appendix D strength-design methodology (or CAN/CSA A23.3 Annex D Limit States Design methodology). It provides cracked and uncracked-concrete anchorage solutions for numerous Simpson Strong-Tie mechanical and adhesive anchors as well as the PAB anchor bolt. With its easy-to-use graphical user interface, the software makes it easy for the Designer to identify anchorage solutions without having to perform time-consuming calculations by hand.

Design loads are calculated using a full shear cone. Coverage on each side of the bolt shall be a minimum of F or reductions must be taken.

Naming Legend: PAB5H-12

PAB Diameter* and Grade Length
Anchor Bolt (12", 18", 24", 30" or 36")

* Units in $\frac{1}{8}$ " Increments
(Ex: 9 = $\frac{9}{8}$ " or 1 $\frac{1}{8}$ ")

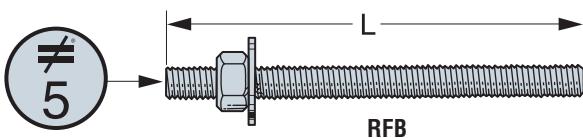

- Anchorage designs conform to ACI 318-11 Appendix D and assume cracked concrete with no supplementary reinforcement.
- Seismic indicates Seismic Design Category C through F. Detached one- and two-family dwellings in SDC C designs conform to ACI 318-11 Section D3.3.4.
- Wind includes Seismic Design Category A and B.
- Foundation dimensions are for anchorage only. Foundation design (size and reinforcement) by Designer. The registered design professional may specify alternate embedment, footing size, and anchor bolt.
- Where tension loads are governed by anchor steel, the design provisions from AISC 360-10 are used to determine the tensile steel limit. LRFD values are calculated by multiplying the nominal AISC steel capacity by a 0.75 phi factor and allowable values are calculated by dividing the AISC nominal capacity by a 2.0 omega factor.
- Where tension loads are governed by an Appendix D concrete limit, the allowable Stress Design (ASD) values are obtained by multiplying Load Factor Resistance Design (LRFD) capacities by 0.7 for Seismic and 0.6 for Wind.

RFB Retrofit Bolts

RFBs are clean, oil-free, pre-cut threaded rod, supplied with nut and washer. Offers a complete engineered anchoring system when used with Simpson Strong-Tie® adhesive. Inspection is easy; the head is stamped with rod length and "No Equal" symbol for identification after installation.

MATERIAL: ASTM F1554 Grade 36

FINISH: Zinc Plated (unless otherwise noted), available in HDG (per ASTM A153); stainless steel (RFB#5x8SS only).

These products feature additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Length L (in)	Bolt Diameter
RFB#4X4	4	1/2
RFB#4X5	5	1/2
RFB#4X6	6	1/2
RFB#4X7	7	1/2
RFB#4X10	10	1/2
RFB#4x8HDG-R	8	1/2
RFB#5X5	5	5/8
RFB#5X8	8	5/8
RFB#5X10	10	5/8
RFB#5X12HDG-R	12	5/8
RFB#5X16	16	5/8
RFB#6X10.5	10 1/2	3/4

1. RFB#4X8HDG-R and RFB#5X12HDG-R are only available with a hot-dip galvanized coating. They are retail packaged and are sold 10 per carton.
2. Washer provided on all RFB (except RFB#5x8SS).

CNW/HSCNW Coupler Nuts

Simpson Strong-Tie® coupler nuts are a tested and load-rated method to join threaded rod and anchor bolts. "Witness" holes in the nut provide a means to verify when rods are properly installed. The positive stop feature helps ensure even threading into each end of the nut. CNW's meet and exceed the tensile capacity of corresponding ASTM A36 bolts and threaded rod. HSCNW's meet and exceed the tensile capacity of corresponding ASTM A449 bolts and threaded rod. Contact Simpson Strong-Tie for other coupler nut sizes.

FINISH: Zinc Plated

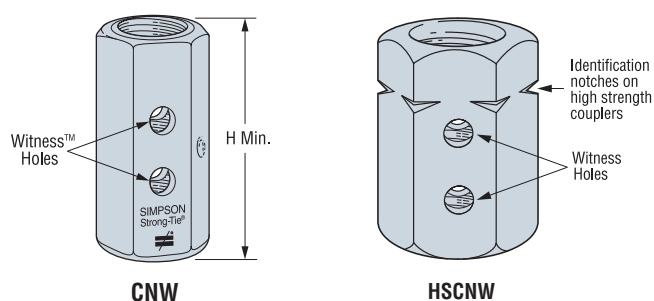

INSTALLATION:

- Tighten the two rods until each all-thread rod is visible in the witness hole.
- For non-hot-dip galvanized all-thread rod only.
- 5/8" and 7/8" diameter couplers available with oversized threads for installation to hot-dip galvanized bolts (order CNW^{5/8}-^{7/8}OST and CNW^{7/8}-^{7/8}OST).

CODES: See page 12 for Code Reference Key Chart.

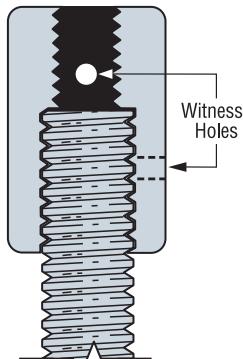

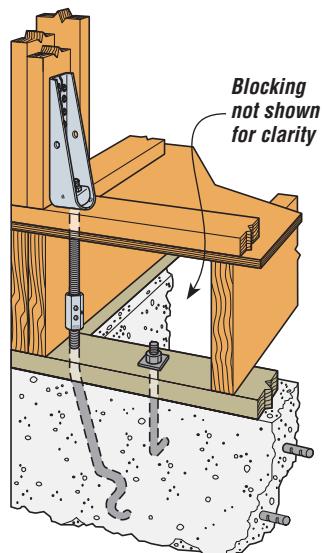

Model No.	Rod Diameter	H Min	Allowable Tension Capacity		Code Ref.

Concrete Connectors & Anchors

BP/LBP Bearing Plates

Bearing plates give greater bearing surface than standard cut washers, and help distribute the load at these critical connections.

The BP $\frac{1}{2}$ -3 and BP $\frac{5}{8}$ -3 are 3"x3" bearing plates that meet the latest requirements of the IRC and IBC. These plate washers are available uncoated or with a hot-dip galvanized (HDG) coating.

The BPS and LBPS are bearing plates that offer increased flexibility while meeting the latest requirements of the code for 2x4 and 2x6 walls. The slotted hole allows for adjustability to account for bolts that are not in the middle of the sill plate.

The BP%SKT uses 1/4"x1 1/2" Strong-Drive® SDS Heavy-Duty Connector screws to provide lateral resistance when 5/8" diameter sill holes are overdrilled (*screws are provided*). The shear capacity of the connection and the sill/anchor bolt shall be determined by the Designer for each installation.

MATERIAL: See table

FINISH: LBP, LBPS—Galvanized; BP $\frac{7}{8}$ -2, BP%S—Zinc Plated; BPS, BP—None. BPs and BPSs may be ordered HDG; LBP and LBPS products may be ordered ZMAX®, contact Simpson Strong-Tie. See Corrosion Information, pages 13-15.

INSTALLATION: • See General Notes.

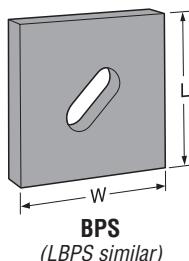

- BP/BPS—For shearwall applications, position edge of plate washer within 1/2" of sheathed edge of sill plate.

CODES: See page 12 for Code Reference Key Chart.

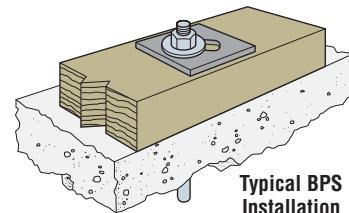

2012 IRC R602.11.1, 2008 SDPWS 4.3.6.4.3 (see footnote 2 below)

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

WT Wedge Form Ties

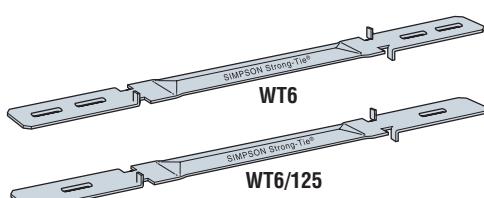

Designed for low foundation wall applications. 5/8" wide formed "V" design for rigidity allows accurate form spacing and support. Sizes now available for composite form board.

MATERIAL: Wedges—14 gauge, WT—18 gauge **FINISH:** Galvanized

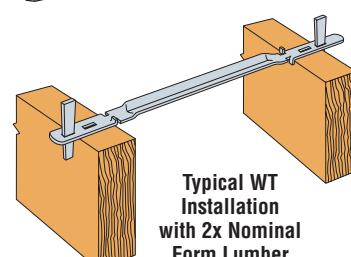

INSTALLATION: • Use two 3 1/2" long wedges for each tie.

- Not recommended for wall pours greater than 4' high.
- Wall thickness from 6" to 12".
- Refer to technical bulletin T-WT for recommended spacing.

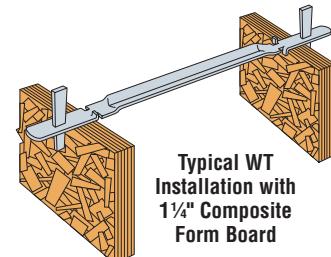

Model No.	Form Board	Wall Thickness

ANCHORMATE® Anchor Bolt Holders

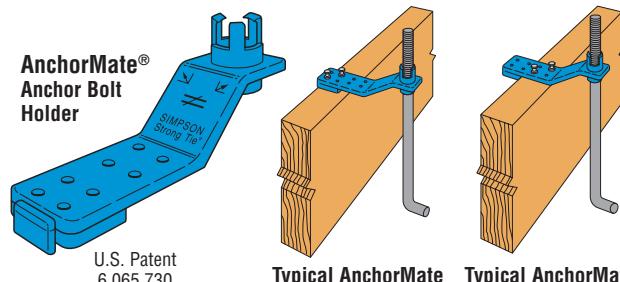

These reusable anchor bolt holders are designed to hold the anchor in place before the concrete pour, as required in some jurisdictions. The gripping section secures the bolt in place without a nut for quicker set up and tear down. It also protects the threads from wet concrete and simplifies trowel finishing.

- Built-in 2x4 and 2x6 stops eliminate measuring.
- Color-coded for easy size identification.
- Use the $\frac{1}{2}$ " and $\frac{5}{8}$ " AnchorMate to secure the SSTB to the formboard before the concrete pour. Alignment arrows (left or right) match the SSTB bolt head arrow.

MATERIAL: Nylon

CODES: See page 12 for Code Reference Key Chart.

Model No.	Dia.	Color	Code Ref.
AM $\frac{1}{2}$	$\frac{1}{2}$	Yellow	180
AM $\frac{5}{8}$	$\frac{5}{8}$	Blue	
AM $\frac{3}{4}$	$\frac{3}{4}$	Red	
AM $\frac{7}{8}$	$\frac{7}{8}$	Green	
AM1	1"	Black	

Typical Anchormate Installation for a 2x6 Mudsill Typical Anchormate Installation for a 2x4 Mudsill

ABS Anchor Bolt Stabilizer

The ABS stabilizes the anchor bolt to prevent it from being pushed against the form during the concrete pour.

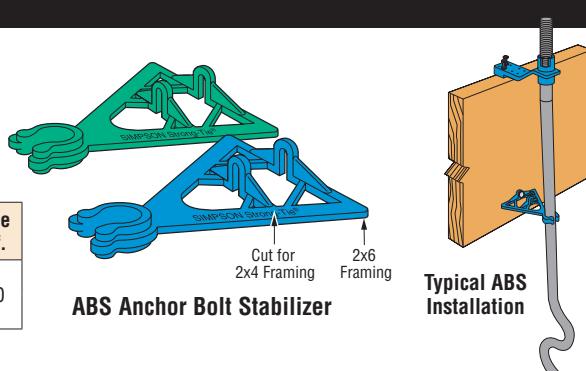

FEATURES:

- Supports the bolt approximately 8" below the top of the concrete.
- Model ABS $\frac{5}{8}$ is for the $\frac{5}{8}$ " SSTB and ABS $\frac{7}{8}$ is for the $\frac{7}{8}$ " SSTB.
- Thin section limits the effect of a cold joint.
- Sized for 2x4 and 2x6 mudsills.

MATERIAL: Engineered Composite Plastic.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Dia.	Color	Code Ref.
ABS $\frac{5}{8}$	$\frac{5}{8}$	Blue	180
ABS $\frac{7}{8}$	$\frac{7}{8}$	Green	

**STRAPMATE® Strap Holder**

The StrapMate is designed to keep the STHD and LSTHD straps vertically aligned during the concrete pour to minimize possibility of spalling. The friction fit allows for quick and easy installation.

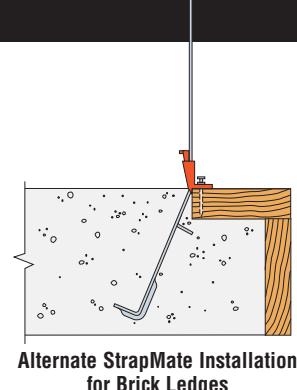

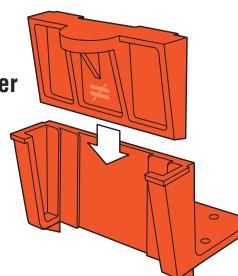

- The StrapMate is reusable.
- Works with STHD, LSTHD.

MATERIAL: Engineered Composite Plastic.

- Designed to fit $\frac{3}{4}$ " plywood forms up to $\frac{1}{4}$ " LVL forms and larger.
- The strap is positioned off the front edge of the form board.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Nails	Code Ref.
SM1	2-8d Duplex	180

**ABL Anchor Bolt Locator**

The ABL enables the accurate and secure placement of anchor bolts on concrete-deck forms prior to concrete placement. The structural heavy-hex nut is attached to a pre-formed steel "chair", which eliminates the need for an additional nut on the bottom of the anchor bolt. Electro-galvanized versions available for HDG anchor bolts. Order ABL-OST when using HDG anchor bolts.

FEATURES:

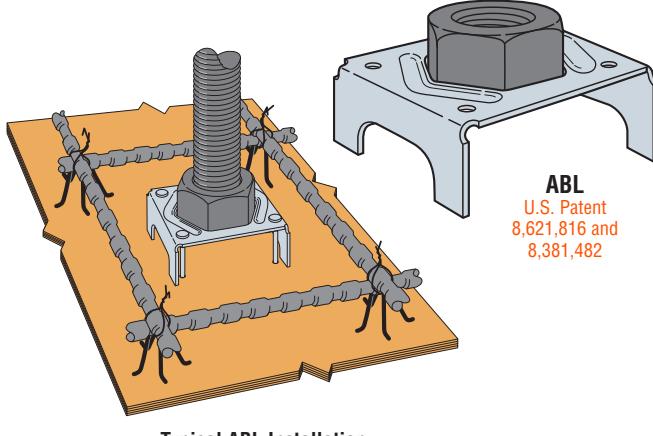

- Designed for optimum concrete flow
- Installed with nails or screws
- Meets code requirement for 1" stand off. Also available with $1\frac{1}{2}$ " standoff. Order ABLXX-1.5.
- PAB anchors are not designed for use with the ABL. Contact Simpson Strong-Tie for pre-assembled anchor solutions to be used with ABL.

MATERIAL: Nut - Heavy hex, Chair - Steel

FINISH: Nut - None or Electro-galvanized; Chair - G90; ABL-OST - HDG

CODES: See page 12 for Code Reference Key Chart.

ANCHORING SYSTEMS *Sill Plate Anchorage and Fastening Solutions*

SIMPSON

Strong-Tie®

Simpson Strong-Tie offers many fastening and post-installed anchorage solutions for sill plate applications in concrete or concrete block foundations. These products are often used in retrofit/expansion applications or when cast-in-place anchors are omitted or mis-located. Various product finishes are available to address most environmental or preservative-treated wood conditions. For more information on product performance, installation requirements, corrosion and appropriate code listings for Simpson Strong-Tie® products, please visit www.strongtie.com.

ANCHORING SYSTEMS

For Cracked-Concrete Applications

SET-XP® High-Strength Anchoring Adhesive

A two-part, high-strength epoxy anchoring adhesive system formulated for threaded rod and rebar anchoring into concrete (*cracked/uncracked*) and masonry, SET-XP is a teal color when mixed, providing easy post-installation identification.

FEATURES:

- Qualified under ICC-ES AC308 regarding elevated temperature and long-term sustained loading conditions
- Code-listed under the IBC/IRC for cracked and uncracked concrete per ICC-ES ESR-2508
- Code-listed under the IBC/IRC for masonry per IAPMO UES ER-265
- Suitable for use under static and seismic loading conditions in cracked and uncracked concrete
- Multiple DOT listings; refer to www.strongtie.com/DOT
- Manufactured in the USA using global materials

CODES: ICC-ES ESR-2508 (concrete); IAPMO UES ER-265 (masonry); City of L.A. RR25744 (concrete); City of L.A. RR25965 (masonry); Florida FL15730 (concrete), FL16230 (masonry); ASTM C 881 (Type I and IV, Grade 3, Class C); NSF/ANSI Standard 61 (216 in²/1000 gal)

AT-XP® High-Strength, Fast-Cure, All-Weather Anchoring Adhesive

Formulated for high-strength anchorage of threaded rod and rebar into concrete (*cracked/uncracked*) and masonry under a wide range of conditions, AT-XP dispenses easily in cold or warm environments and, when mixed, is a dark teal color for easy post-installation identification.

FEATURES:

- Qualified under ICC-ES AC308 regarding reduced temperature, elevated temperature, and long-term sustained loading conditions
- Code-listed under the IBC/IRC for cracked and uncracked concrete per IAPMO UES ER-263
- Code-listed under the IBC/IRC for masonry per IAPMO UES ER-281
- Fully cures in temperatures as low as 14°F (-10°C)
- Suitable for use under static and seismic loading conditions in cracked and uncracked concrete
- Manufactured in the USA using global materials

CODES: IAPMO UES ER-263 (concrete), ER-281 (masonry); City of L.A. RR25960 (concrete), RR25966 (masonry); Florida FL 16230, NSF/ANSI Standard 61 (43.2 in²/1000 gal)

ET-HP® Anchoring Adhesive

A two-part epoxy anchoring adhesive system formulated for threaded rod and rebar anchoring into concrete (*cracked/uncracked*) and masonry.

FEATURES:

- Qualified under ICC-ES AC308 regarding elevated temperature and long-term sustained loading conditions
- Code-listed under the IBC/IRC for cracked and uncracked concrete per ICC-ES ESR-3372
- Code-listed under the IBC/IRC for **uncracked** masonry per IAPMO UES ER-241
- Suitable for use under static and seismic loading conditions in cracked and uncracked concrete
- Multiple DOT listings; refer to www.strongtie.com/DOT
- Manufactured in the USA using global materials

CODES: ICC-ES ESR-3372 (concrete); ICC-ES ESR-3638 (unreinforced masonry); IAPMO UES ER-241 (masonry); City of L.A. RR25120 (unreinforced masonry); ASTM C 881 (Type I, II, IV and V, Grade 3, Class B and C, except gel time)

STRONG-BOLT® 2 Wedge Anchor

A wedge-type expansion anchor designed for optimum performance in cracked and uncracked concrete and **uncracked** masonry, the Strong-Bolt 2 is available in carbon-steel (1/4" through 1" diameter) and Type 316 stainless steel (1/4" through 3/4" diameter).

FEATURES:

- Code-listed under IBC/IRC for cracked and uncracked concrete per ICC-ES ESR-3037
- Code-listed under IBC/IRC for masonry per IAPMO UES ER-240
- Qualified for static and seismic loading conditions

CODES: ICC-ES ESR-3037 (concrete); IAPMO UES ER-240 (carbon steel in CMU); City of L.A. RR25891 (concrete), RR25936 (carbon steel in CMU); Florida FL 15731; UL File Ex3605; FM 3043342 and 3047639; meets the requirements of Federal Specifications A-A-1923A, Type 4

TORQ-CUT™ Self-Undercutting Anchor

A heavy-duty, high-capacity, self-undercutting anchor designed for cracked and uncracked concrete applications, the Torq-Cut has a built-in cutting ring that provides superior load-carrying capacity.

FEATURES:

- Code-listed under IBC/IRC for cracked and uncracked concrete per ICC-ES ESR-2705
- Provides higher load-carrying capacity than conventional mechanical anchors
- Excellent for resisting seismic (SDC A-F) and vibratory loads
- No special installation tools required

CODES: ICC-ES ESR-2705 (concrete); City of L.A. RR25946 (concrete); Florida FL15731

U.S. Patent 7,357,613

ANCHORING SYSTEMS For Cracked-Concrete Applications

SIMPSON

Strong-Tie®

TITEN HD® Concrete ScrewU.S. Patent
5,674,035 & 6,623,228

The original, patented, high-strength screw anchor that offers industry-leading performance in cracked and uncracked concrete and **uncracked** masonry, the Titen HD installs with low installation torque for maximum efficiency.

FEATURES:

- Code-listed under IBC/IRC in accordance with ICC-ES AC193 for cracked and uncracked concrete per ICC-ES ESR-2713; includes Titen HD® Rod Hanger (models THD37212RH and THD50234RH only)
- Code-listed under IBC/IRC in accordance with ICC-ES AC106 for masonry per ICC-ES ESR-1056
- Qualified for static and seismic loading conditions
- Standard fractional sizes; no special drill bits required
- Removable; ideal for temporary anchoring applications like formwork or bracing

CODES: ICC-ES ESR-2713 (concrete), ICC-ES ESR-1056 (masonry); City of L.A. RR25741 (concrete), RR25560 (masonry); Florida FL 15730; FM 3017082, 3035761 and 3043442

ANCHORING SYSTEMS For General-Purpose Applications**SET® Anchoring Adhesive**

A non-shrink, epoxy based anchoring system, SET is formulated for anchoring threaded rod and rebar in a wide range of base materials.

FEATURES:

- Code-listed under the IBC/IRC for URM per ICC-ES ESR-1772
- Excellent as a pick-proof sealant around doors, windows and fixtures
- CalTrans and multiple DOT listings; refer to www.strongtie.com/DOT
- Manufactured in the USA using global materials

CODES: ICC-ES ESR-1772 (URM); City of L.A. RR25279 (**masonry**); Florida FL 15730; ASTM C 881 (Type I, II and IV, Grade 3, Class B and C); NSF/ANSI Standard 61 (216 in²/1000 gal) – except SET 1.7KTA

AT Fast-Cure, All-Weather Anchoring Adhesive

An acrylic-based adhesive anchoring system, AT is formulated for use as a high-strength **anchoring** material for threaded rod and rebar in a wide range of temperatures and base materials.

FEATURES:

- Code-listed under the IBC/IRC for URM per ICC-ES ESR-1958
- Fully cures in temperatures as low as 0°F (-18°C)
- Multiple DOT listings; refer to www.strongtie.com/DOT
- Manufactured in the USA using global materials

CODES: ICC-ES ESR-1958 (URM); Florida FL 14832; ASTM C 881 (Type I and IV, Grade 3, Class A, B and C – except AT is a non-epoxy formulated for fast cure time); NSF/ANSI Standard 61 (2.2 in²/1000 gal)

WEDGE-ALL® Wedge Anchor

A non-bottom bearing, wedge-style expansion anchor for use in solid concrete or grout-filled masonry, the Wedge-All is available in carbon steel, mechanically galvanized, and Types 303/304/316 stainless steel.

FEATURES:

- Code-listed under the IBC/IRC for CMU per ICC-ES ESR-1396
- One-piece, wrap-around clip ensures uniform holding capacity
- Chamfered thread end for ease of starting nut
- Wide range of diameters and lengths for added versatility

CODES: ICC-ES-ESR-1396 (CMU); City of L.A. RR24682 (**CMU**); Florida FL 15730; FM 3017082 and 3131136; UL File Ex3605; meets the requirements of Federal Specifications A-A-1923A, **Type 4**.

Note: The Tie-Wire Anchor is not code-listed.

GENERAL INFORMATION AND NOTES

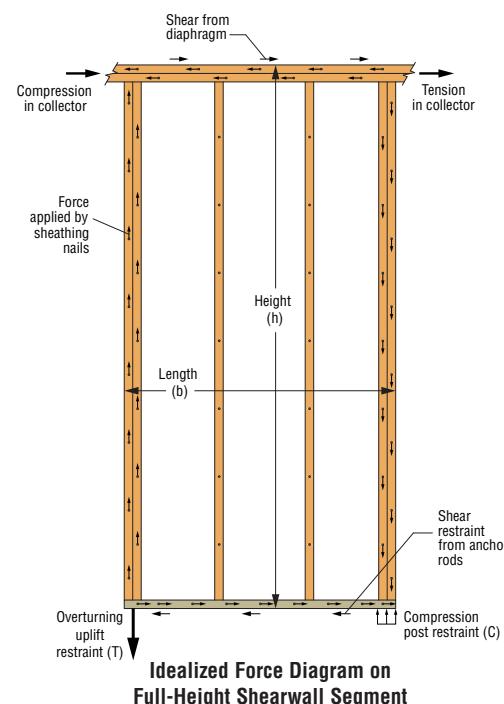

Holdowns and tension ties represent key components that comprise a continuous load path. In light-frame construction, holdowns are typically used to resist uplift due to shearwall overturning or wind uplift forces. In panelized roof construction, holddowns are used to anchor the concrete or masonry walls to the roof framing.

Holdowns can be separated into two categories – post-installed or cast-in-place. Cast-in-place holdowns, such as the STHD holdowns or the PA purlin anchors are installed at the time of concrete placement and attached to wood framing with nails. Cast-in-place holdowns are an economical anchorage solution with capacities up to 5,300 lbs.

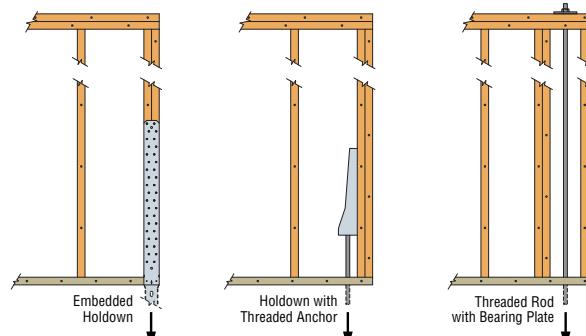

After the concrete has been placed, post-installed holdowns are attached to anchor bolts during wall framing. They are attached to the wood framing with nails, Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws or bolts and have capacities ranging from about 2000 lbs. up to nearly 20,000 lbs.

Holdown and Tension Tie General Notes:

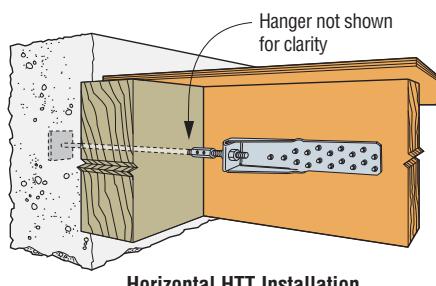

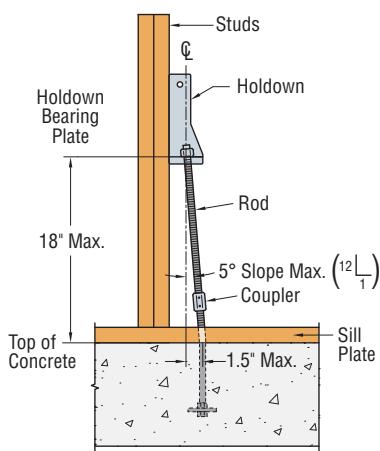

- Allowable loads have been increased for earthquake or wind load durations with no further increase allowed. Reduce where other loads govern.
- Use all specified fasteners.
- The Designer must specify anchor bolt type, length and embedment. See pages 33-37 for SB and SSTB anchor bolts and page 38 for PAB anchor bolts.
- Anchor bolt nut should be finger tight plus $\frac{1}{3}$ to $\frac{1}{2}$ turn with a hand wrench, with consideration given to possible future wood shrinkage. Care should be taken not to over-tighten the nut. Impact wrenches should not be used.
- Post or beam design by Specifier. Tabulated loads are based on a minimum $3\frac{1}{2}$ " wide post (in a $3\frac{1}{2}$ " wall), unless noted otherwise. Posts may consist of multiple members provided they are connected independently of the holdown fasteners. See pages 245-246 for common post allowable loads.
- Holdowns are for use in vertical or horizontal applications.
- Tension values are valid for holdowns installed flush or raised off the sill plate.
- Deflection at Allowable Tension Load is determined by testing on wood posts and includes fastener slip, holdown deformation and anchor rod elongation for holdowns installed 6" above top of concrete ($4\frac{1}{2}$ " for HTT).
- Holdowns may be installed raised up to 18" above the top of concrete with no load reduction provided that additional elongation of the anchor rod is accounted for.
- Tabulated loads for bolted holdowns may be doubled when holdowns are installed on opposite sides of the wood member. Designer must evaluate the capacity of the wood member and the anchorage.
- Tabulated loads for nailed or screwed holdowns may be doubled when holdowns are installed on opposite sides of the wood member. Member must be thick enough to prevent opposing holdown fastener interference or the holdowns are offset to eliminate fastener interference. Designer must evaluate the capacity of the wood member and the anchorage. See pages 245-246 for common post allowable loads.
- Structural composite lumber columns have sides that either show the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See Technical Bulletin T-C-SCLCLM for load reductions due to narrow face installations.

Purlin-to-Purlin Cross-Tie Detail

Holdown Raised Off Sill Plate

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

HDU holdowns are pre-deflected during the manufacturing process, virtually eliminating deflection under load due to material stretch. They use Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws which install easily, reduce fastener slip and provide a greater net section when compared to bolts.

The HDU series of holdowns are designed to replace previous versions of the product such as PHDs as well as bolted holdowns. The HDU 2, 4 and 5 are direct replacements for the PHD2, 5 and 6, respectively.

The DTT tension ties are designed for lighter-duty holdown applications on single or 2x posts. The new DTT1Z is installed with nails or Simpson Strong-Tie Strong-Drive SD Connector screws and the DTT2Z installs easily with the Strong-Drive SDS Heavy-Duty Connector screws (*included*). The DTT1Z holdowns have been tested for use in designed shearwalls and prescriptive braced wall panels as well as prescriptive wood-deck applications (see page 209 for deck applications).

For more information on holdown options, contact Simpson Strong-Tie.

HDU SPECIAL FEATURES:

- Holdown designs virtually eliminate deflection due to material stretch.
- Uses Strong-Drive SDS Heavy-Duty Connector screws which install easily, reduce fastener slip, and provide a greater net section area of the post compared to bolts.
- Strong-Drive SDS Heavy-Duty Connector screws are supplied with the holdowns to ensure proper fasteners are used.
- No stud bolts to countersink at openings.

MATERIAL: See table

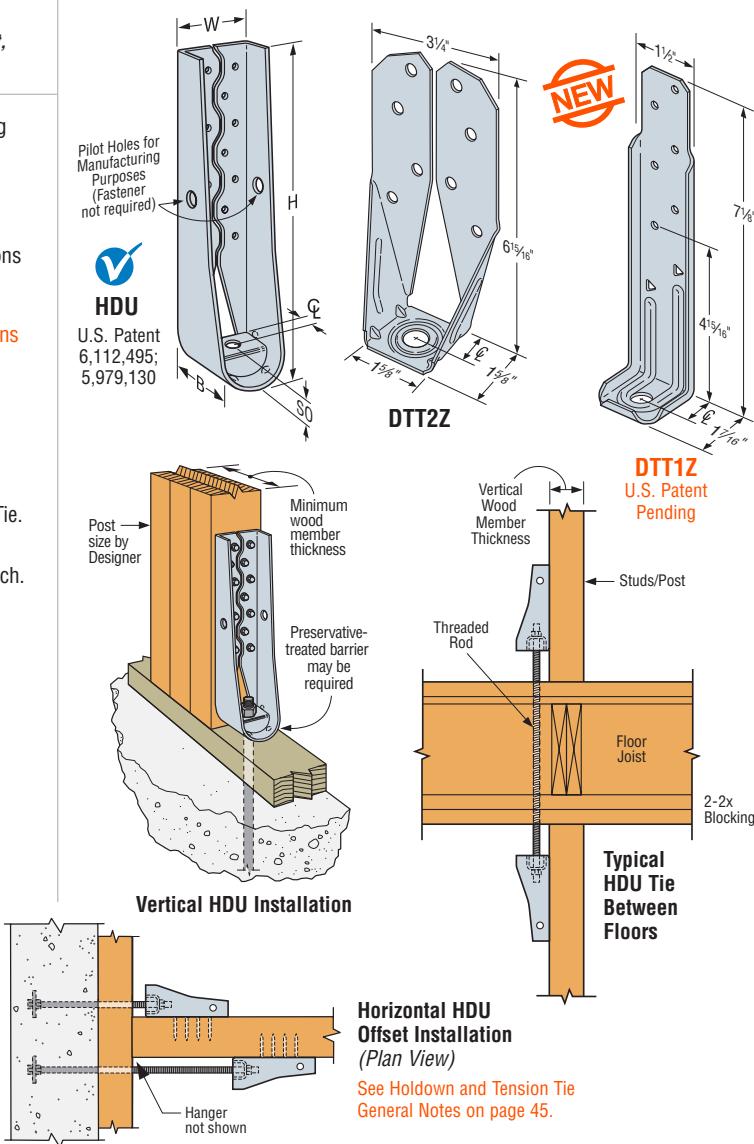

FINISH: HDU – Galvanized; DTT1Z and DTT2Z – ZMAX® coating;
DTT2SS – stainless steel

INSTALLATION: • See General Notes on page 45.

- The HDU requires no additional washer, the DTT requires a standard cut washer (*included with DTT2Z*) be installed between the nut and the seat.
- Strong-Drive SDS Heavy-Duty Connector screws install best with a low speed high torque drill with a $\frac{3}{8}$ " hex head driver.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

See Holdown and Tension Tie General Notes on page 45.

										5½ ^{2,3}			

1. See page 45 for Holdown and Tension Tie General Notes.

2. Noted HDU14 allowable loads are based on a 5½" wide post (6x6 min.).

3. HDU14 requires heavy hex anchor nut to achieve tabulated loads (*supplied with holdown*).

4. Loads are applicable to installation on either narrow or wide face of post.

HDQ8/HHDQ Holdowns

The HHDQ series of holdowns combines low deflection and high loads with ease of installation. The unique seat design of the HDQ8 greatly minimizes deflection under load. Both styles of holdown employ the Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws which install easily, reduce fastener slip and provide a greater net section area of the post compared to bolts. They may be installed either flush or raised off the mudsill without a reduction in load value.

SPECIAL FEATURES:

- Uses Strong-Drive SDS Heavy-Duty Connector screws which install easily, reduce fastener slip, and provide a greater net section area of the post compared to bolts.
- Strong-Drive SDS Heavy-Duty Connector screws are supplied with the holdowns to ensure proper fasteners are used.
- No stud bolts to countersink at openings.

MATERIAL: HDQ8—7 gauge; HHDQ—Body: 7 gauge, washer: $\frac{1}{2}$ " plate

FINISH: HDQ8—Galvanized; HHDQ—Simpson Strong-Tie® gray paint

INSTALLATION: • See General Notes on page 45.

- No additional washer is required.
- Strong-Drive SDS Heavy-Duty Connector screws install best with a low speed high torque drill with a $\frac{3}{8}$ " hex head driver.

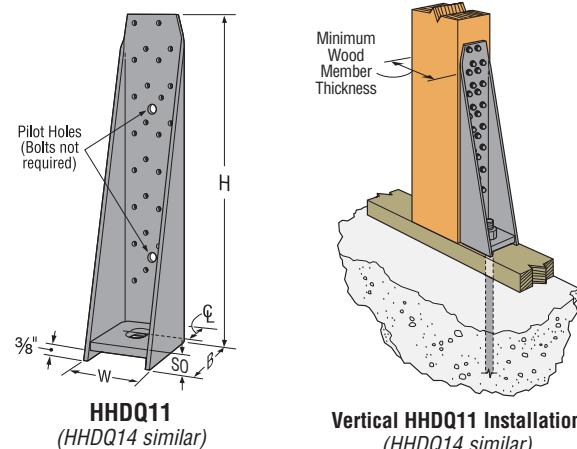

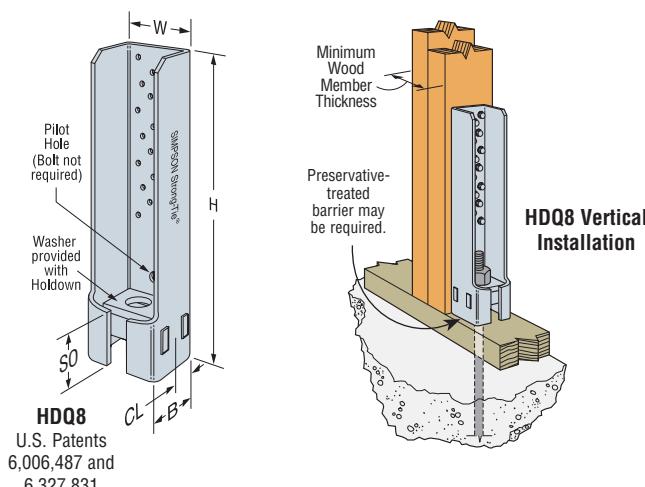

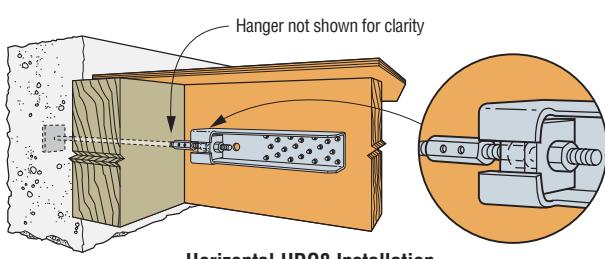

HDQ8:

- $\frac{5}{8}$ " of adjustability perpendicular to the wall.

HHDQ11/14:

- No additional washer is required.
- HHDQ14 requires a heavy hex anchor nut (*supplied with holdown*)

CODES: See page 12 for Code Reference Key Chart.

**Not sure you have the right holdown?**

Our Holdown Selector software is a great tool to help you select the best product for the job. Visit www.strongtie.com/software.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Ga	Dimensions (in.)					Fasteners		Minimum Wood Member Thickness ⁴ (in.)	Allowable Tension Loads (160)			Code Ref.

								30-SDS $\frac{1}{4}'' \times 2\frac{1}{2}''$	5 $\frac{1}{2}$ ²	13710	10745	0.107	

1. See page 45 for Holdown and Tension Tie General Notes.

2. Noted HHDQ14 allowable loads are based on a 5 $\frac{1}{2}$ " wide post (6x6 min.). Other loads based on 3 $\frac{1}{2}$ " wide post minimum.

3. HHDQ14 requires heavy-hex anchor nut (*supplied with holdown*).

4. HDQ and HHDQ installed horizontally achieve compression loads with the addition of a standard nut on the underside of the load transfer plate. Refer to ICC-ES ESR 2320 for design values. HDQ8 requires a standard nut and BP $\frac{1}{2}$ -2 (*sold separately*) load washer on the underside of the holdown for compression load. Design of anchorage rods for compression force shall be per the Designer.

HDC Concentric Holdown

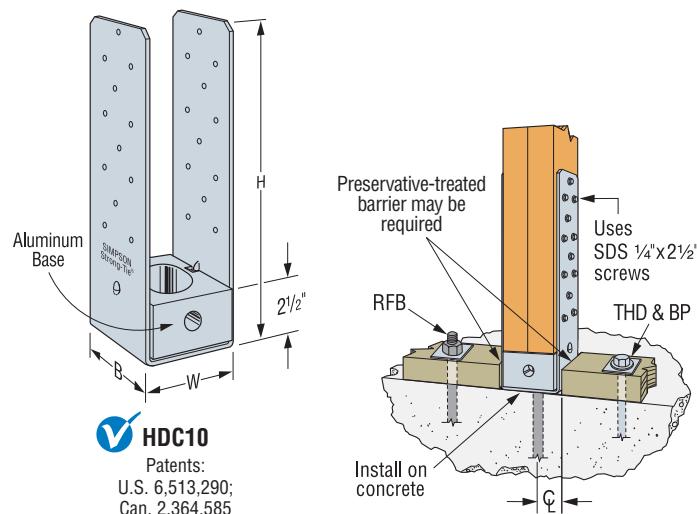

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The unique design of the HDC holdowns eliminate eccentricity. They install with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws (*included*) to reduce slip and provide a greater net section area of the post compared to bolts.

MATERIAL: 10 gauge strap **FINISH:** Galvanized strap, aluminum base
INSTALLATION: • See General Notes on page 45.

- Install on concrete.
- Sized for 2-2x, and 4x. Center 2-2x posts on holdown.
- Uses Strong-Drive SDS Heavy-Duty Connector screws supplied with the holdowns to ensure proper fasteners are used.
- Slot in the seat allows for $\frac{3}{8}$ " of adjustment perpendicular to plate.
- Cut washer required between base and anchor nut. HDC10 models use narrow cut washer with outside diameter of $1\frac{3}{4}$ ".
- Witness slot in the base to inspect the nut.
- Maximum anchor bolt height above concrete is $2\frac{1}{8}$ ".
- Aluminum standoff cannot be in contact with preservative-treated wood.
- Strong-Drive SDS Heavy-Duty Connector screws install best with a low speed high torque drill with a $\frac{3}{8}$ " hex head driver.

CODES: See page 12 for Code Reference Key Chart.

Typical HDC Installation
with 2-2x4 Studs
(Similar with 2-2x6 studs)

Model No.	Post Size	W	H	B	C	Anchor Bolt	Number of SDS $\frac{1}{4}$ " x $2\frac{1}{2}$ "	Allowable Tension Loads DF/SP (160)	Allowable Tension Loads SPF/HF (160)	Allowable Download DF/SP (100)	Allowable Download DF/SP (160)	Deflection at Highest Allowable Tension Load	Code Ref.
HDC10/22-SDS2.5	2-2x4	$3\frac{1}{8}$	$14\frac{3}{8}$	3	$1\frac{1}{16}$	$\frac{7}{8}$	24	9135	6575	7070	9255	0.054	I6, L8
HDC10/4-SDS2.5	4x4	$3\frac{3}{16}$	$14\frac{3}{8}$	3	$1\frac{13}{16}$	$\frac{7}{8}$	24	9135	6575	9600	10550	0.054	

1. See page 45 for Holdown and Tension Tie General Notes.

2. The HDCs will be limited by wood compression capacity if installed on a sill plate. HDC10/22 will achieve an allowable load of 4005 lbs. on a DFL plate. HDC10/4 will achieve an allowable load of 4940 lbs. on a DFL plate, which does not take deflection into account. Full tension values apply when installed on a sill, deflections may be higher.
3. Higher values may be obtained when HDC is not placed at an edge or with f_c concrete strength > 2500 psi.

MSTD Marriage Strap

The MSTD marriage strap provides an overlapping, in-line splice between an HTT tension tie and a CMSTC16 coiled strap for panelized-roof applications where the roof member adjacent to the wall is too short to develop the required load into the roof diaphragm. The MSTD provides continuity of load without the need to splice the CMSTC16 alongside the HTT which requires additional blocking. Use MSTD4 with HTT4 and MSTD5 with HTT5.

MATERIAL: 16 gauge **FINISH:** Galvanized (G90)

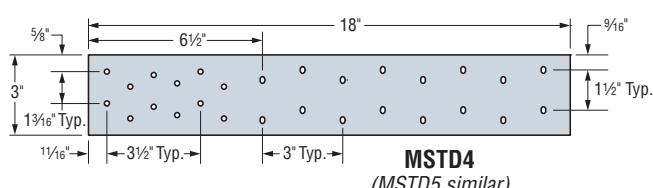

INSTALLATION: • Use all specified fasteners. See General Notes.

- The CMSTC and HTT must be spliced end-to-end without any gap.
- Suitable for use with both 10d and 16d sinker nailing options for the HTT and CMSTC as specified per the Designer.
- To install:
 - Position HTT over the framing (*do not install fasteners yet*).
 - Align CMSTC16 with the end of the HTT.
 - Position MSTD over the two connectors so that nail holes align correctly.
 - Install specified fasteners, filling all nail holes.

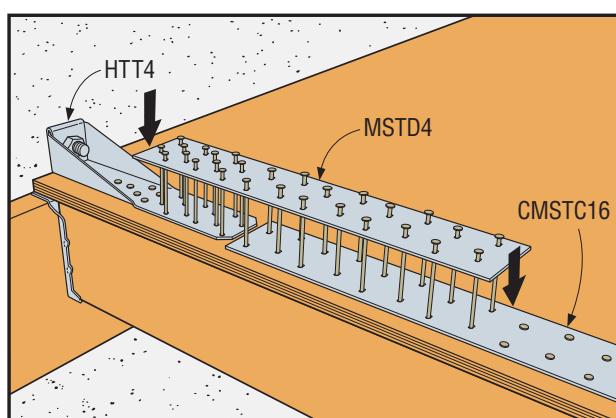

CODES: See page 12 for Code Reference Key Chart.

Model No.	Total L	Tension Tie	Fasteners		Allowable Tension Loads	Code Ref.
			CMSTC16	HTT		
MSTD4	18	HTT4	16 - 16d Sinker	12 - 16d Sinker	3100	160
MSTD5	27	HTT5	24 - 16d Sinker	18 - 16d Sinker	4545	

1. Install on minimum 4x4 blocking.
2. 10d common nails may be substituted at 100% of table load.
3. Allowable tension loads include a load duration increase on the fasteners for wind or earthquake with no further increase allowed.
4. **NAILS:** 10d common = $0.148"$ dia. x $3"$ long, 16d sinker = $0.148"$ dia. x $3\frac{1}{4}$ " long. See pages 22-23 for other nail sizes and information.

MSTD4
(MSTD5 similar)

Typical MSTD4 Installation

LTT/HTT Tension Ties

Tension ties offer a solution for resisting tension loads that are fastened with nails. The HTT4 and HTT5 are the latest generation of tension ties. They feature an optimized nailing pattern which results in better performance with less deflection. Designed to meet new code standards, the HTT4 and HTT5 offer higher loads than their predecessors.

HTT5KT is sold as a kit with the holdown, bearing plate washer and Strong-Drive® SD Connector screws. The HTT5-¾ is designed to use a ¾" diameter anchor bolt. ¾" epoxied anchor bolts are commonly used when retrofitting tension ties to horizontal wood members.

The LTT19 Light Tension Tie is designed for 2x joists or purlins and the LTT20B is for nail- or bolt-on applications. The 3" nail spacing makes the LTT20B suitable for wood I-joints with 10dx1½". The LTTI31 is designed for wood chord open web truss attachments to concrete or masonry walls and may also be installed vertically on a minimum 2x6 stud.

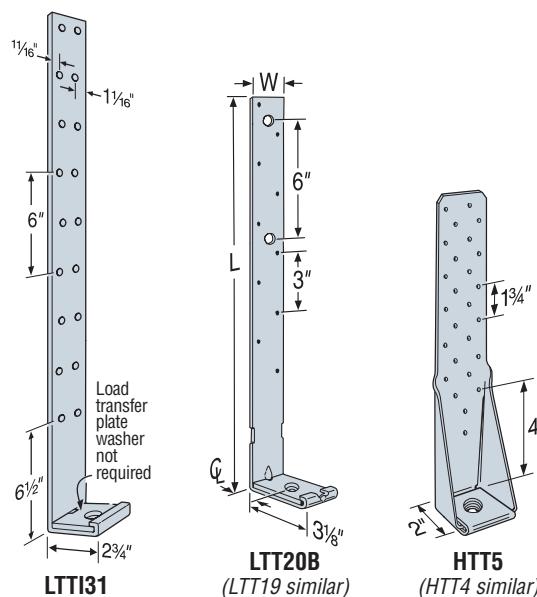

MATERIAL: See table

FINISH: Galvanized. May be ordered HDG; contact Simpson Strong-Tie.

INSTALLATION:

- See General Notes on page 45.
- A standard cut washer is required for LTT19 and LTT20B when using ½" or ¾" anchor bolts. No additional washer is required when using ¾" anchor bolt.

CODES: See page 12 for Code Reference Key Chart.

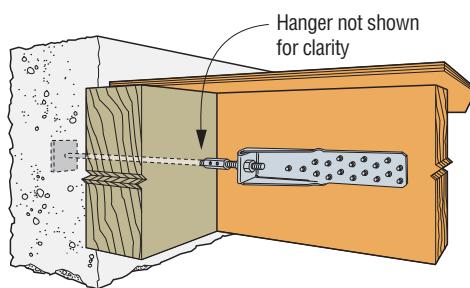

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

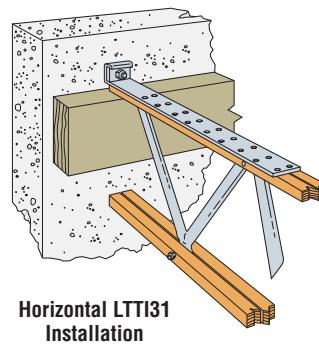

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

Vertical HTT4 Installation

HDB/HD Holdowns

Simpson Strong-Tie offers a wide variety of bolted holdowns offering low-deflection performance for a range of load requirements.

The HD3B is a light-duty holdown designed for use in shearwalls and braced-wall panels, as well as other lateral applications.

The HD5B, HD7B and HD9B bolted holddowns incorporate the proven design of our HDQ8 SDS-style holdown and feature a unique seat design which greatly minimizes deflection under load. HDB holdowns are self-jigging, ensuring that the code-required minimum of seven bolt diameters from the end of the post is met. They can be installed directly on the sill plate or raised above it and are suitable for back-to-back applications where eccentricity is a concern. HDBs are designed to provide loads for intermediate-load-range shearwalls, braced-wall panels and lateral applications.

HD holdowns offer the highest allowable loads, providing high capacity for both vertical and horizontal applications. The HD12 and HD19 are self-jigging, ensuring that the code-required minimum of seven bolt diameters from the end of the post is met. They can be installed back-to-back when eccentricity is an issue.

MATERIAL: See table

FINISH: HD3B/HD5B/HD7B/HD9B – Galvanized;

HD – Simpson Strong-Tie® gray paint

INSTALLATION: • See General Notes on page 45.

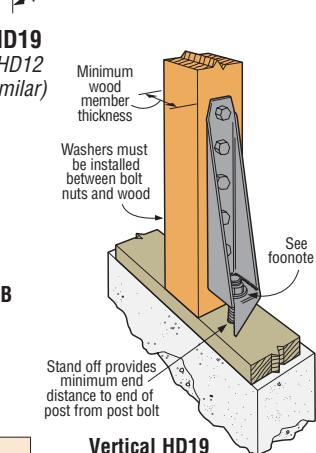

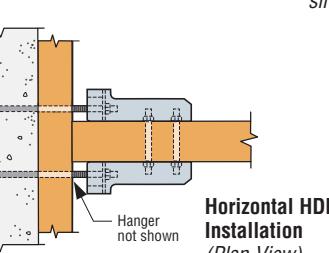

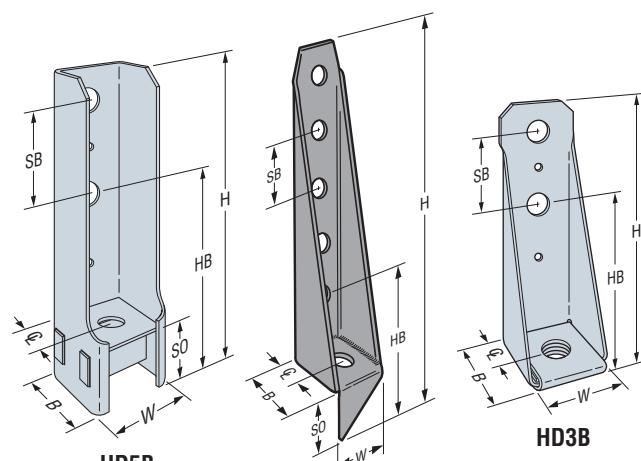

- Bolt holes shall be a minimum of $\frac{1}{32}$ " to a maximum of $\frac{1}{16}$ " larger than the bolt diameter (*per 2012 NDS, section 11.1.3.2*).
- Stud bolts should be snugly tightened with standard cut washers between the wood and nut (*BPs are required in the City and County of Los Angeles*).
- HD and HDB holdowns are self-jigging and will ensure minimum bolt end distance when installed flush with the sill plate.**
- Standard cut washer is required under the anchor nut for HD12 with 1" anchor and HD19 with $1\frac{1}{8}$ " anchors.**

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- To achieve published loads, machine bolts shall be installed with the nut on the opposite side of the holdown. If reversed, the Designer shall reduce the allowable loads shown per NDS requirements when bolt threads are in the shear plane.
- Lag bolts will not develop the listed loads.

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The STHD is an embedded strap-tie holdown offering high load capacity and a staggered nail pattern to help minimize splitting. The STHD incorporates many features that aid correct installation and improve performance. When installed on the forms with the StrapMate® strap holder the unique design of the STHD delivers enhanced stability before and during the pour to help prevent both parallel and perpendicular movement (*relative to the form*). This results in accurate positioning of the strap and reduced possibility of spalling.

FEATURES

- The nailing pattern allows for nailing to the edges of double 2x's
- Strap nail slots are countersunk to provide a lower nail head profile
- The slots below the embedment line enable increased front-to-back concrete bond and help to reduce spalling
- Rim joist models accommodate up to a 17" clear span without any loss of strap nailing

MATERIAL: LSTHD8, LSTHD8RJ—14 gauge, all others—12 gauge

FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes on page 45.

- Use table below for both standard concrete and post-tension slab installations.
- Install before concrete pour with a StrapMate, or other holding device.
- Nail strap from the bottom up. Install strap plumb.
- Strap may be bent one full cycle (*bent horizontal 90° then bent vertical*) to aid wall placement, but may cause spalling behind the strap. If the spall is 1" or less, measured from the embedment line to the bottom of the spall, full loads apply. 1" to 4" spalls for LSTHD8 achieve 0.9 times table loads. STHD10 and STHD14 achieve full load for spalls less than 4". Any portion of the strap left exposed should be protected against corrosion.
- Other than where noted in the two-pour detail, do not install where:
 - (a) a horizontal cold joint exists within the embedment depth between the slab and foundation wall or footing beneath, unless provisions are made to transfer the load, or the slab is designed to resist the load imposed by the anchor; or
 - (b) slabs are poured over concrete block foundation walls.
- Additional studs attached to the shearwall studs or post may be required by the Designer for wall sheathing nailing.
- Wood shrinkage after strap installation across horizontal members may cause strap to buckle outward.

- Allowable loads are for wind or seismic loading. Nail quantities reflect an increase for duration of load with no further increase allowed. Reduce where other loads govern.
- Concrete shall have a minimum concrete strength, f'_c of 2500 psi.
- 10d common (3" long x 0.148") or 10d x 2 $\frac{1}{2}$ " (2 $\frac{1}{2}$ " long x 0.148") nails may be used as a direct replacement for the required nails shown in the table with no load reduction when installed directly over framing or over 1 $\frac{1}{2}$ " max. structural sheathing.
- Use the specified number of nails listed in table or as specified. In many cases, not all nail holes will be filled. Nail strap from the bottom up.
- Deflection at highest allowable loads for install over wood double studs

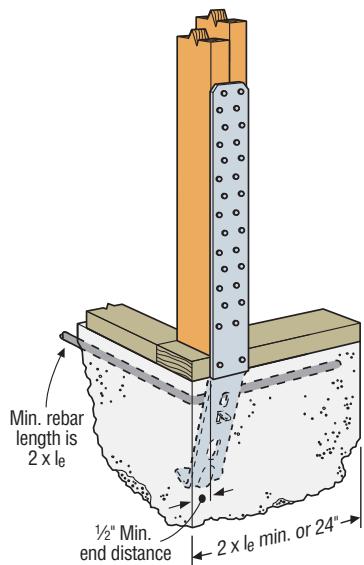

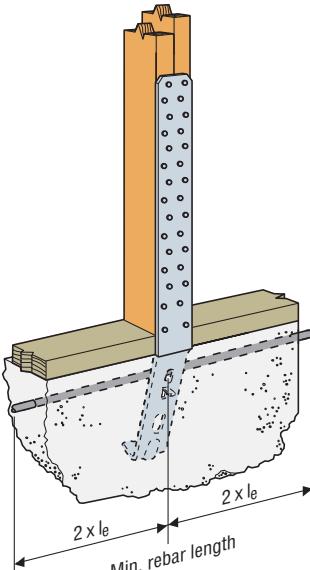

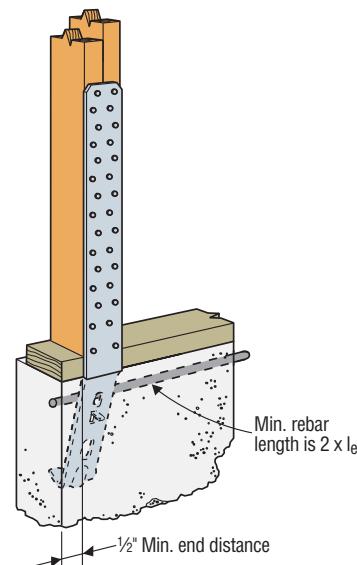

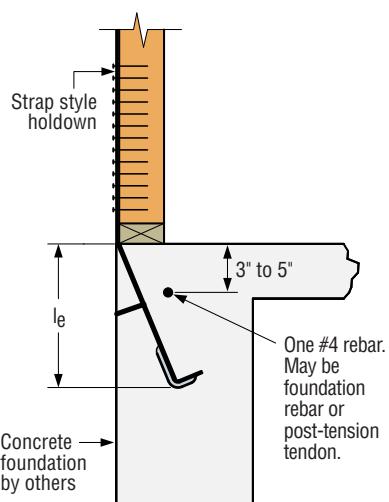

- are as follows: Installed on framing: LSTHD8 = 0.089", STHD10 = 0.117" and STHD14 = 0.118". Installed over 1 $\frac{1}{2}$ " maximum structural sheathing: LSTHD8 = 0.114", STHD10 = 0.146" and STHD14 = 0.164".
- Multiply Seismic and Wind ASD load values by 1.4 or 1.6 respectively to obtain LRFD capacities.
 - Per 2009 and 2012 IBC Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
 - Minimum center-to-center spacing is 3 times the required embedment (S_{min} = 3xI_e) for STHD's acting in tension simultaneously. Midwall install is based on 1.5xI_e end distance.
 - See T-SCLCOLUMN for installation on structural composite lumber posts or columns.
 - For brick ledge applications, use full loads shown for STHD14 installed in 8" stemwall.
 - NAILS:** 16d sinker = 0.148" dia. x 3 $\frac{1}{4}$ " long. See pages 22-23 for other nail sizes and information.

For Two-Pour Installation for Downturn Footings

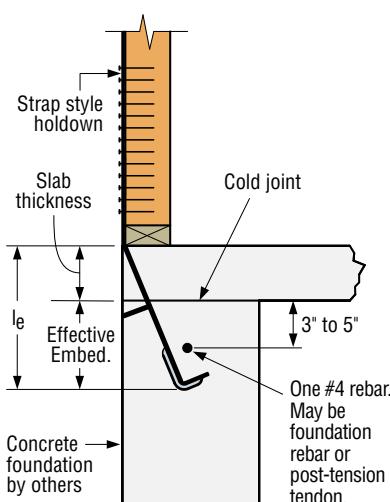

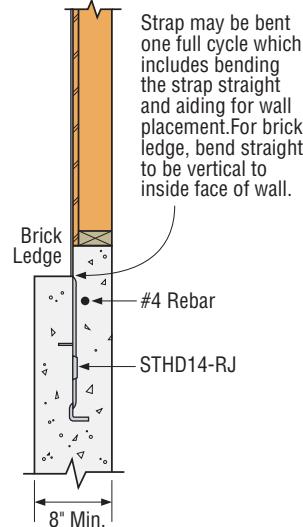

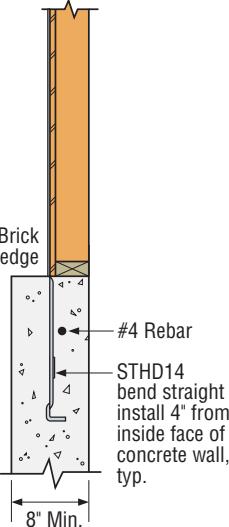

- For STHD10 installed through a 4" thick slab, use the equivalent 8" stemwall loads of the LSTHD8.
- For STHD14 installed through a 4" thick slab, use the equivalent 8" stemwall loads of the STHD10.
- For STHD14 installed through a 6" thick slab, use the equivalent 8" stemwall loads of the LSTHD8.

Spall Reduction System for STHD Holdown

FEATURES

- Built-in tab.
- StrapMate® locator line.
- Additional diamond hole in RJ versions.

BENEFITS

Built-in Tab:

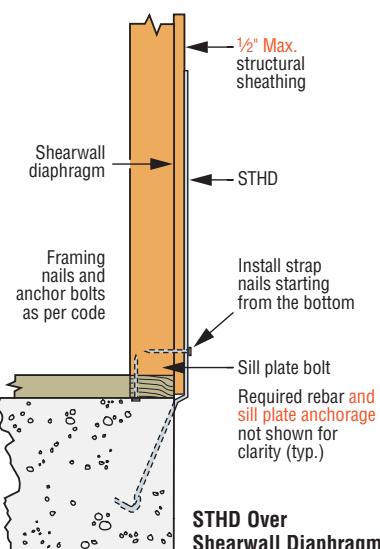

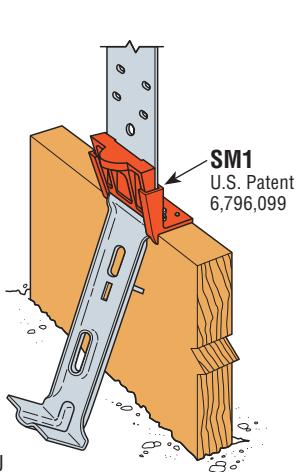

- Reduces spalling and costly retrofits.
- No additional labor to install.
- Holds STHD away from form board.

StrapMate Locator Line:

- Easy inspection to ensure proper location.
- Allows adjustment without removing STHD.

Additional Diamond Hole:

- One more fastener to help prevent the STHD RJ models from bowing out at the rim joist section.

STHD Over
Shearwall Diaphragm

PA strap tie holdowns are wood-to-concrete connectors that connect studs to the foundation to satisfy engineering and code requirements.

MATERIAL: 12 gauge

FINISH: Galvanized or ZMAX® coating

INSTALLATION:

- Use all specified fasteners. See General Notes.
- For additional length, an MST strap can be attached using $\frac{1}{2}$ " bolts through existing holes.
- Refer to technical bulletin T-PAUPLIFT for additional information.

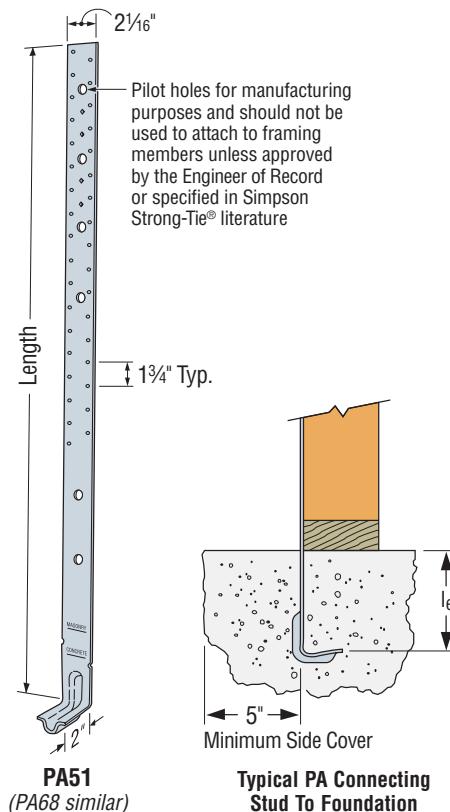

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

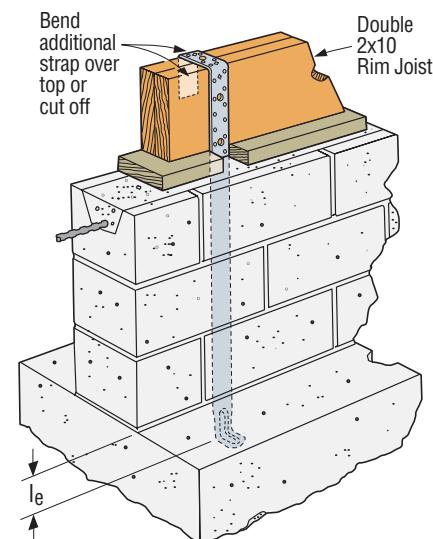

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

Typical PA51 Installation
(PA68 similar)

PA/HPA Purlin Anchors

PA/HPA purlin anchors offer solutions for wood to concrete and concrete block connections which satisfy code requirements. The PA's dual embedment line allows installation in concrete or concrete block.

MATERIAL: PA—12 gauge; HPA—10 gauge

FINISH: Galvanized. PA's available HDG or ZMAX® coating

INSTALLATION:

- Use all specified fasteners; some models have extra fastener holes. See General Notes.
- Purlin Anchor must hook around rebar.
- Allowable loads are for a horizontal installation into the side of a concrete or masonry wall.
- Strap may be bent one full cycle. (*Bent vertical 90° then bent horizontal.*)

EDGE DISTANCE—Minimum concrete edge distance is 5".

Minimum concrete block left-to-right edge distance is 20".

CONCRETE BLOCK WALL—The minimum wall specifications are:

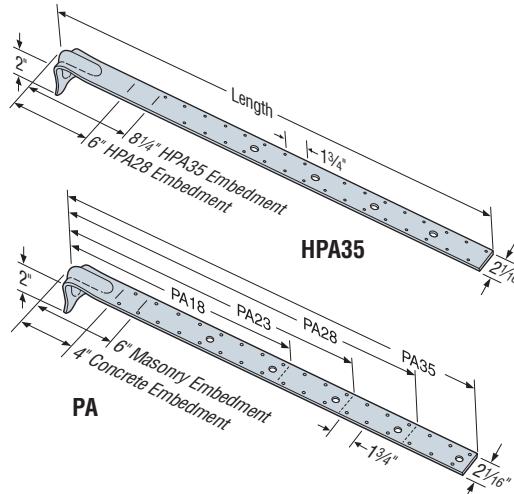

- [A] One #4 vertical rebar, 32" long, 16" each side of anchor;
- [B] Two courses of grout filled block above and below the anchor (*no cold joints allowed*);
- [C] A horizontal bond beam with two #4 rebars, 40" long, a maximum of two courses above or below the anchor.
- [D] Minimum masonry compressive strength, $f'_m = 1500$ psi.

OPTIONS: See LTT and HTT Tension Ties for alternate retrofit solutions.

CODES: See page 12 for Code Reference Key Chart.

ASCE7-10 12.11.2.2.5 states:

... Diaphragm to structural wall anchorage using embedded straps shall have the straps attached to or hooked around the reinforcing steel, or otherwise terminated to effectively transfer forces to the reinforcing steel.

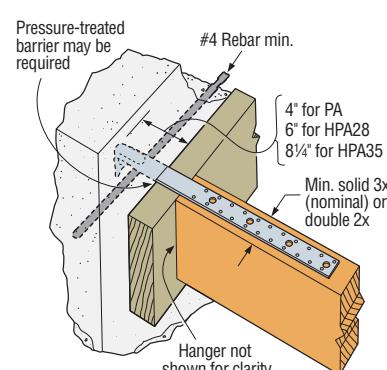

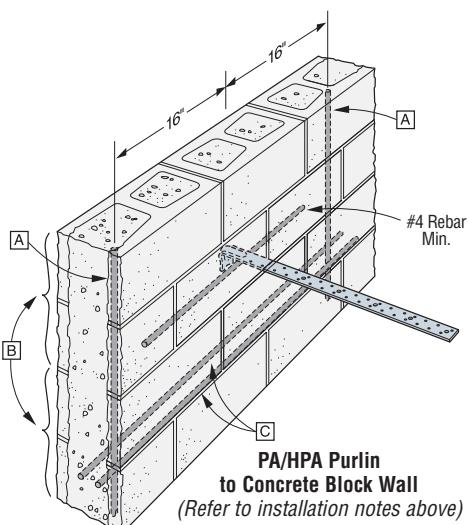

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

PA/HPA Purlin to Concrete Wall

For I-Joist applications
see page 139.

1. Allowable loads have been increased for earthquake or wind load durations with no further increases allowed.
2. Deflection at highest allowable loads are as follows: PA18 = 0.087", PA23 = 0.118", PA28 = 0.085", PA35 = 0.085", PA51 & 68 = 0.010", HPA28 = 0.133" and HPA35 = 0.132".
3. Multiply Seismic and Wind ASD load values by 1.4 or 1.6 respectively to obtain LRFD capacities.
4. Minimum center-to-center spacing is 3 times the required embedment. Standard installation is based on minimum 5" end distance.
5. For wall anchorage systems in SDC C-F, the maximum allowable strap tensile capacity shall not be less than 1.4 times the ASD anchor design load per ASCE7-10 12.11.2.2.2.
6. Nail quantities are based on Douglas Fir (DF) and Southern Pine (SP). For use on Spruce-Pine-Fir (SPF) or Hem-Fir (HF) nail quantities must be increased by 1.15 to achieve allowable loads – alternatively, loads may be decreased by a 1.15 factor.
7. Concrete shall have a minimum concrete strength, f'_c of 3000 psi.
8. For Masonry Installation Loads, see 'Non-Cracked Concrete' for Required Nails.
9. 10dx1 1/8" nails may be substituted for 10d commons with no load reduction and with a 15% increase in deflection. For installation over sheathing use 3" minimum nail lengths.
10. Minimum $f'_m = 1500$ psi for masonry.
11. **NAILS:** 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

RPBZ Retrofit Post Base

The new RPBZ Retrofit Post Base is designed to reinforce existing posts and columns. The single, versatile model will fit on any size post consisting of a double 2x4 or larger. RPBZ can also be used to reinforce new post-base connections, such as braced carports, patio covers, decks and other structures. The RPBZ can be installed with the CPS composite plastic standoff to meet a 1" post standoff code requirement. A single RPBZ can be installed on a post that is flush to a corner, and two RPBZs can be installed at away from edge conditions to fortify the post base connection to resist both wind and seismic forces.

Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws install easily and provide excellent holding strength for post-to-flange connections. Additionally, the RPBZ can be purposed as a temporary base fixture for posts when shoring beams. RPBZ comes standard in ZMAX® finish to meet exposure conditions in many environments. See additional Corrosion information at www.strongtie.com/corrosion.

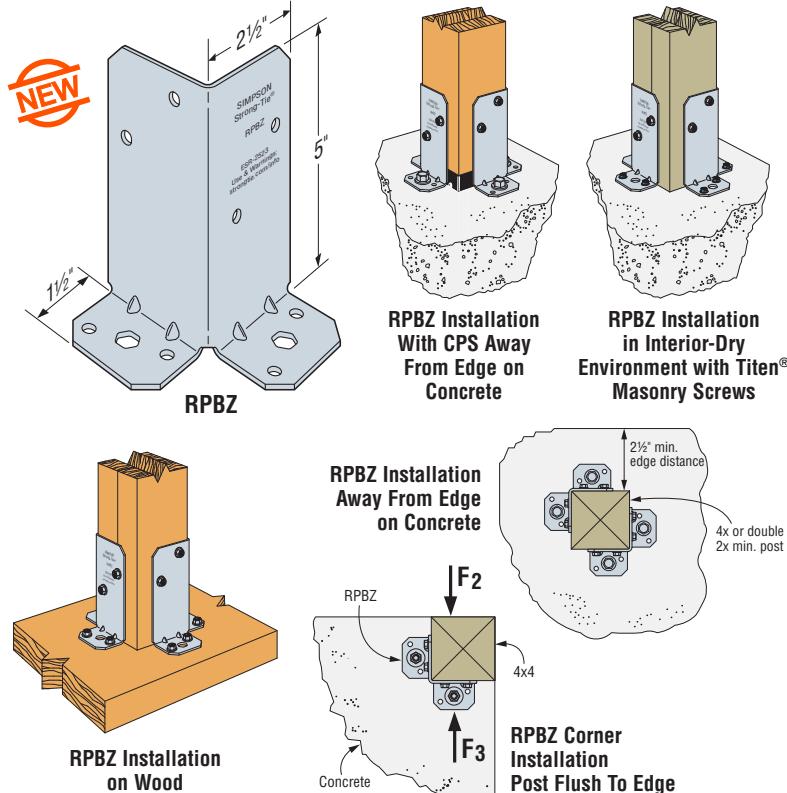

MATERIAL: 12 gauge

FINISH: ZMAX coating

INSTALLATION: • Use all specified fasteners. See General Notes.

- Simpson Strong-Tie 1/4" x 1 1/2" Strong-Drive SDS Heavy-Duty Connector and base connection fasteners are not provided with RPBZ. Simpson Strong-Tie CPS series Composite Post Stand-Off sold separately.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations, such as fences or unbraced car ports.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

	2		% ⁸ " Diameter Anchor	4	3635	2595	1730	1730				

1. Allowable load for design shall not exceed minimum of Connector Only Value and Anchorage to Concrete Value.
2. Allowable connector loads are based on DF/SP lumber. For SPF/HF, multiply table loads by 0.72.
3. Double 2x4s may be used in lieu of 4x4 post.
4. For installation on 6x members, if four RPBZs are used, allowable loads may be taken to be 1.5 x the tabulated two-part value.
5. For installations into concrete, minimum compressive strength, f'c = 2500 psi. Designer is responsible for concrete member uplift design.
6. Away From Edge loads require face of wood post to be a minimum of 2 1/2" away from near edge of concrete on all four sides of the post.
7. Allowable anchorage to concrete uplift and shear loads for the %⁸" diameter anchors are calculated per ACI 318-11, Appendix D. Shear loads assume cracked concrete

- while uplift loads consider both cracked and uncracked concrete values and all are qualified for Wind and Seismic Design Categories A&B.
8. Embedment depth for these post-install anchors must be a minimum 2 3/4" and are for use with SET-XP® or AT-XP® structural anchoring adhesives or Titen HD® screw anchors.
 9. Allowable uplift and shear loads for the Titen® masonry screws do not carry a particular "cracked" or "uncracked" designation.
 10. Titen® masonry screws and Titen HD screw anchors should only be used in interior-dry and non-corrosive environments.
 11. Threads on Strong-Drive® SDS Heavy-Duty Connector screws into wood framing must be fully engaged into a structural wood member.

ABA/ABU/ABW Adjustable and Standoff Post Bases

Additional standoff bases are on page 232.

The AB series of retrofit adjustable post bases provide a 1" standoff for the post, are slotted for adjustability and can be installed with nails, Strong-Drive® SD Connector screws or bolts (ABU). Depending on the application needs, these adjustable standoff post bases are designed for versatility, cost-effectiveness and maximum uplift performance.

Features:

- The slot in the base enables flexible positioning around the anchor bolt, making precise post placement easier
- The 1" standoff helps prevent rot at the end of the post and meets code requirements for structural posts installed in basements or exposed to weather or water splash

MATERIAL: Varies (see table)

FINISH: All galvanized, most offered in ZMAX®, see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

- See our Anchoring and Fastening Systems for Concrete and Masonry catalog, or visit www.strongtie.com for retrofit anchor options or reference technical bulletin T-ANCHORSPEC.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).
- Place the base, load transfer plate and nut on the anchor bolt. Loosely tighten the nut.

ABW—Place the standoff base and then the post in the ABW and fasten on three vertical sides, using nails or Strong-Drive SD Connector screws.

- Make any necessary adjustments to post placement and tighten the nut securely on the anchor bolt.
- Bend up the fourth side of the ABW and fasten using the correct fasteners.

ABU—Place the standoff base and then the post in the ABU.

- Fasten using nails or Strong-Drive SD Connector screws or bolts (ABU88Z, ABU1010Z – SDS optional).

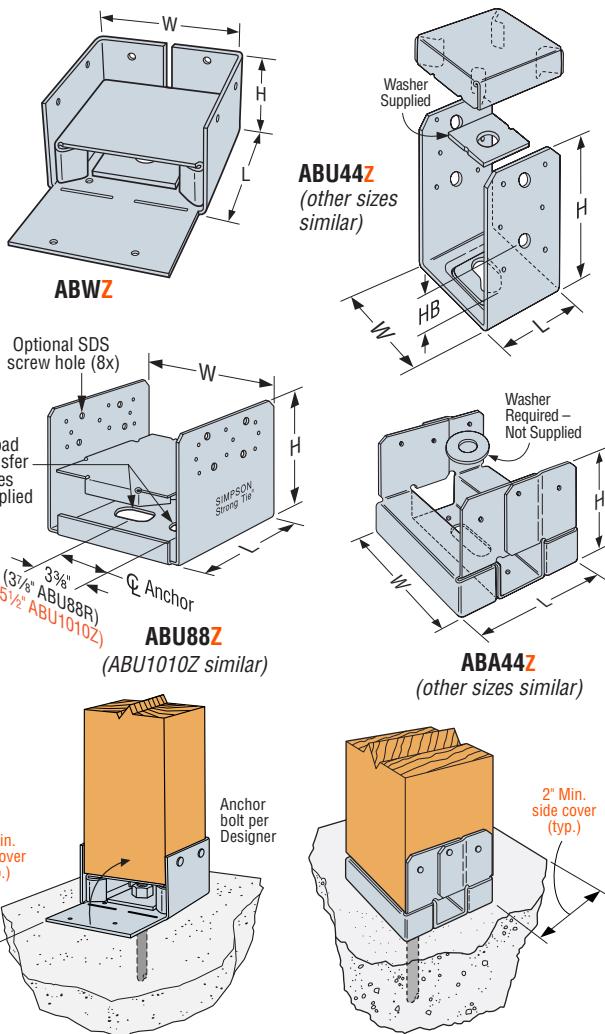

ABA—Place the post in the ABA.

- Fasten using nails or Strong-Drive SD Connector screws.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

Typical ABWZ Installation

Typical ABA44Z Installation

- Uplift loads have been increased for wind or earthquake with no further increase allowed; reduce where other loads govern.
- Downloads may not be increased for short-term loading.
- Specified to design concrete for uplift capacity.
- ABU products may be installed with either bolts or nails (*not both*) to achieve table loads. ABU88Z, ABU88R, ABU1010Z, and ABU1010RZ may be installed with 8-1/4" x 3" Strong-Drive® SDS Heavy-Duty Connector screws (*sold separately*) for the same table load.
- For AB bases, higher download can be achieved by solidly packing grout under 1" standoff plate before installation. Base download on column, grout, or concrete according to the code.
- HB dimension is the distance from the bottom of the post up to the first bolt hole.
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. For SCL columns, the fasteners for these products should always be installed in the wide face.
- Downloads shall be reduced where limited by the capacity of the post. See pages 245-246 for common post allowable loads.
- NAILS:** 16d = 0.162" dia. x 3 1/2" long, 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

CPTZ Concealed Post Tie

The CPTZ concealed post base provides a clean, concealed look while providing a 1" standoff height above concrete. The 1" standoff reduces the potential for decay at the post end and satisfies code requirements for posts that are exposed to weather, water splash or in basements.

- The CPTZ is tested and load-rated for uplift, download and lateral load.
- Simpson Strong-Tie saves installers time by providing all the necessary components to make the connection in one box.
- The CPTZ anchorage can either be cast-in-place or retrofitted with adhesive or mechanical anchors.
- Solutions have been calculated per ACI 318, Appendix D to determine their allowable load in different concrete configurations.

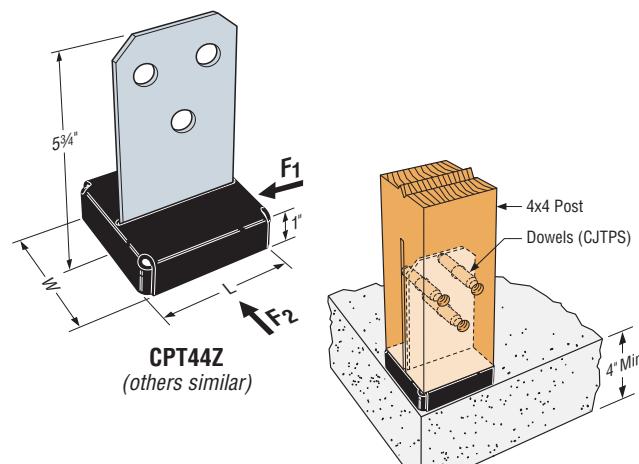

MATERIAL: See table below

FINISH: Knife plate, washers and standoff base are ZMAX®-galvanized steel. The standoff base has an additional textured, flat black powder coat finish for aesthetic purposes. The ½" diameter drift dowels are mechanically galvanized in accordance with ASTM B695, class 55. If substituting ½" diameter machine bolts, a hot-dip galvanized finish is recommended.

INSTALLATION: • Use all specified fasteners. See General Notes.

- More extensive installation instructions are available through our Literature Library app or by visiting www.strongtie.com.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non-braced, or non-top-supported installations.

CODES: See page 12 for Code Reference Key Chart.

Typical CPT44Z Installation

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

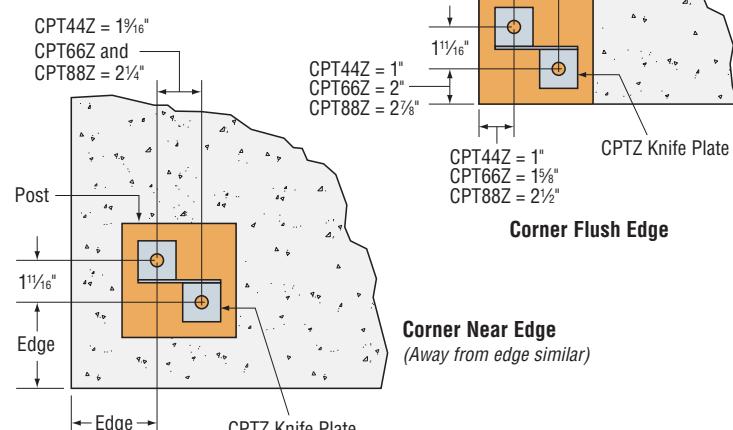

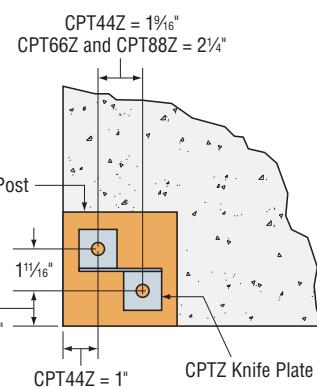

Model No.	Post Size	Base (Ga)	Knife Plate (Ga)	Dimensions (in.)		Fasteners				Allowable Loads (DF/SP)				Code Ref.

									1/2" MB	4475					

- Uplift loads have been increased for wind or earthquake load with no further increase allowed; reduce where other loads govern.
- Downloads may not be increased for short-term loading and shall not exceed the post capacity. See pages 245-246 for common post capacities.
- CPTZs are supplied with (3) ½" diameter dowel pins.

Alternate ½" diameter hex or square head machine bolts may be used for loads listed.

4. Lag or carriage bolts are not permitted.

5. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect dowel or bolt installation into the wide face.

Corner Near Edge
(Away from edge similar)

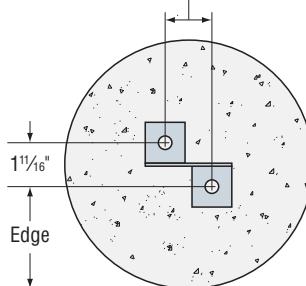

- Allowable uplift loads are calculated per ACI 318-11, Appendix D considering cracked and uncracked concrete and are qualified for Wind and Seismic Design Categories A & B. No further increases allowed.
- Edge distance is measured from the center line of the nearest anchor bolt to the edge of concrete.
- Foundation dimensions are for anchorage only. Foundation design by others. Refer to ACI318-11.
- Lateral loads (F₁ = F₂) for Corner - Flush Edge conditions are CPT44Z = 395 lbs., CPT66Z = 570 lbs., CPT88Z = 740 lbs. For all other installations using CPTZ with SET-XP® anchoring adhesive, use the allowable loads from the CPTZ table above.
- Concrete shall have a minimum compressive strength, f'c = 2500 psi..

CPTZ Cast-in-Place Anchorage

CPT66Z	5	4 3/4	5140	4110	4430
CPT88Z	5	4 3/4	5140	4110	3625

1. Allowable uplift loads are calculated per ACI 318-11, Appendix D considering cracked and uncracked concrete and are qualified for Wind and Seismic Design Categories A & B. No further increases allowed.
2. Edge distance is considered to be measured from the center line of the nearest anchor bolt to the edge of concrete.
3. Tabulated anchor embedments will also achieve the maximum lateral loads from the CPTZ table on page 57.
4. Foundation dimensions are for anchorage only. Foundation design by others. Refer to ACI318-11.

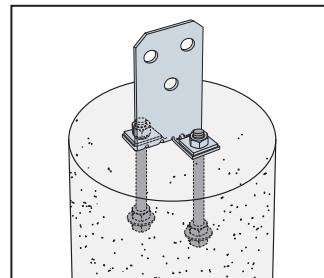

CPT44Z = 1 1/16"
CPT66Z and CPT88Z = 2 1/4"

Circular Pedestal Edge Distance

Corner Installation

Circular Pedestal Installation

EPB Elevated Post Bases

MATERIAL: EPB44A—14 gauge; others—12 gauge base plate, 1 1/16" OD x 8" pipe

FINISH: EPB44A—Galvanized; all others—Simpson Strong-Tie® gray paint (may be ordered HDG); see Corrosion Information, pages 13-15.

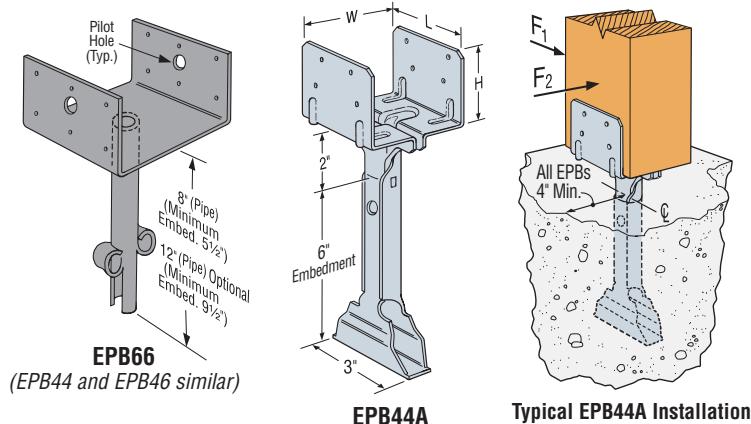

INSTALLATION: • Use all specified fasteners. See General Notes.
• Allows 1" to 2 1/2" clearance above concrete, 2" for EPB44A.
• Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).

OPTIONS: 12" pipe available for EPB44, 46, 66; specify "12" after model number.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

1. Loads may not be increased for short-term loading.
2. Concrete shall have a minimum compressive strength, $f_c' = 2500$ psi.
3. Multiply Seismic and Wind ASD load values by 1.4 or 1.6 respectively to obtain LRFD capacities.
4. In accordance with IBC Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
5. Download shall be reduced where limited by the design capacity of the column. See pages 245-246 for common post allowable loads.
6. For lateral loads: F_1 allowable = 815 lbs. for the EPB44A and 985 lbs. for EPB44, 46 and 66. F_2 allowable = 935 lbs. for the EPB44A and 1135 lbs. for EPB44, 46 and 66.
7. Designer is responsible for concrete design.
8. For full loads, nearest concrete edge required is 4" from EPB center line.
9. Structural composite lumber columns have sides that either show the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See Technical Bulletin T-C-SCLCLM for load reductions due to narrow face installations.
10. NAILS: 16d = 0.162" dia. x 3 1/2" long. See pages 22-23 for other nail sizes and information.

EPB44T/EPB44PHDG Elevated Post Bases

EPB44PHDG can be used both for pier block and cast-in-place installation for 4x4 posts.

MATERIAL: 12 gauge base EPB44T—Threaded rod support $\frac{5}{8}'' \times 6''$ (shipped assembled). EPB44PHDG—Threaded rod support $\frac{3}{4}'' \times 6''$, nut and washer are shipped assembled

FINISH: EPB44T: Base—Galvanized, Threaded Rod—Zinc Plate
EPB44PHDG: HDG; see Corrosion Information, pages 13-15.

INSTALLATION:**Secured with Anchoring Adhesive:**

EPB44T—Drill a $\frac{3}{4}''$ hole 4" deep minimum into the concrete. Clean the hole and fill half full with anchoring adhesive (per installation instructions). Insert the EPB44T and adjust to the desired height. The threaded rod shall be embedded a minimum of $3\frac{1}{2}''$. To adjust after the anchoring adhesive cures, drill a hole in the center of the post and rotate the post base up or down to the desired height.

EPB44PHDG—Drill a $\frac{7}{8}''$ diameter hole 4" deep minimum and fill the hole halfway with anchoring adhesive. Insert the EPB44PHDG and adjust to the desired height. The threaded rod shall be embedded a minimum of $3\frac{1}{2}''$. Minimum sidecover is 3" from the center of the threaded rod for both products.

- Go to www.strongtie.com for additional information on hole cleaning procedures and cure time for SET-XP® and AT-XP® anchoring adhesives.

Supported by a Nut:

EPB44T—Drill a $\frac{3}{4}''$ hole $2\frac{1}{2}''$ deep minimum into concrete. Install a $\frac{5}{8}-11$ NC nut and cut washer on the threaded rod. (Nut and washer not supplied). Insert EPB44T into the hole and adjust to the desired height.

EPB44PHDG—Drill a 1" diameter hole $3\frac{1}{2}''$ deep minimum. Insert the EPB44PHDG and adjust to the desired height.

Cast-in-Place:

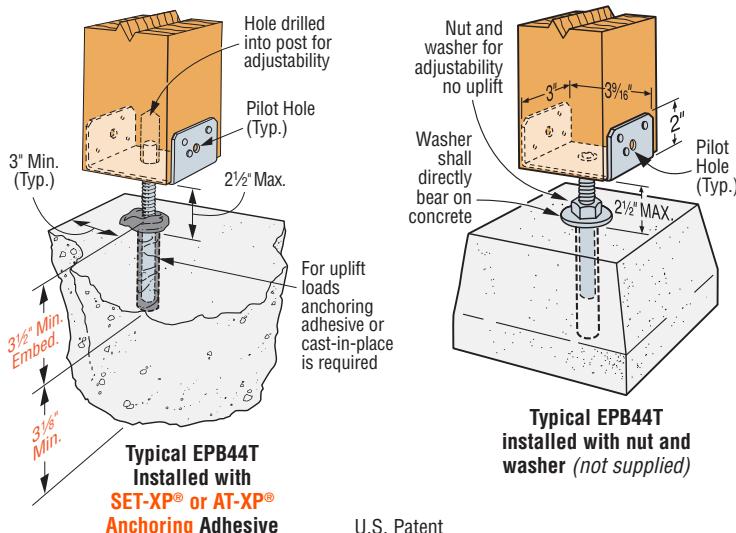

Embedded end to have a nut and bearing plate with a minimum embedment of 4" from top of concrete to the top of plate.

- Minimum sidecover is 3" from the center of the threaded rod.
- Fully engage at least three threads in the base.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).

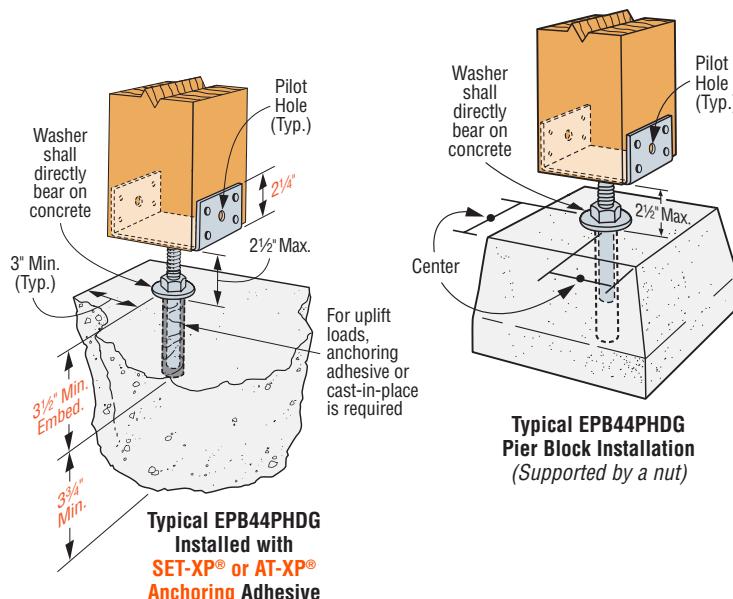

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

U.S. Patent
5,666,774

Model No.	Nails	Anchor Bolt	Allowable Loads (DF/SP)			Code Ref.	
			Download (100)	Uplift (160)			
				SET-XP	AT-XP		
EPB44T	6-16d	$\frac{5}{8}$	3275	1130	1140	170	
EPB44PHDG	8-16d	$\frac{3}{4}$	3670	1265	985		

1. Loads may not be increased for short term loading.
2. Uplift loads require the threaded rod to be attached to cured concrete with SET-XP or AT-XP anchoring adhesive. Cast-in-place install must have a nut and bearing plate embedded in concrete. Uplift loads do not apply when installed to a pier block.
3. Designer is responsible for concrete design.
4. Downloads shall be reduced where limited by the capacity of the post. See pages 245-246 for common post allowable loads.
5. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. For SCL columns, the fasteners for these products should always be installed in the wide face. See technical bulletin T-C-SCLCCLM for load reductions due to narrow face instructions.
6. Adhesive anchor design assumptions: a) Uncracked dry concrete; b) Anchors not for use in SDC C-F where load combos include earthquake; c) Temperature range 1 or 2 acceptable; d) Periodic special inspection assumed per code report; e) Minimum concrete strength of 2,500 psi.
7. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}''$ long. See pages 22-23 for other nail sizes and information.

PB/PBS Regular and Standoff Post Bases

The PBS features a 1" standoff height. It reduces the potential for decay at post and column ends.

MATERIAL: PB—12 gauge; PBS—see table

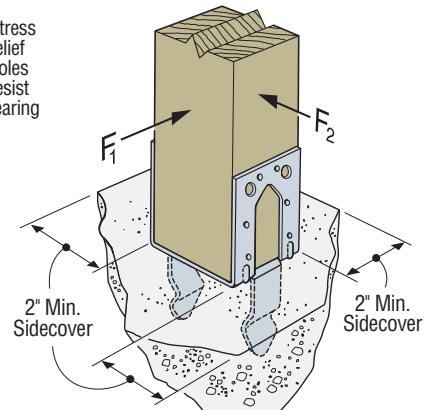

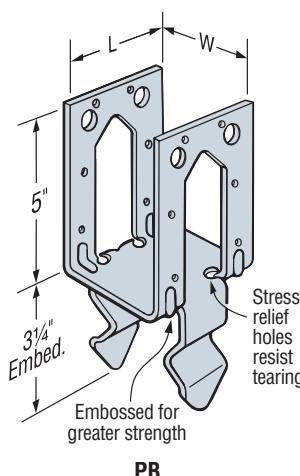

FINISH: Galvanized. Some products available in ZMAX® or HDG coating; see Corrosion Information, pages 13-15.

INSTALLATION:

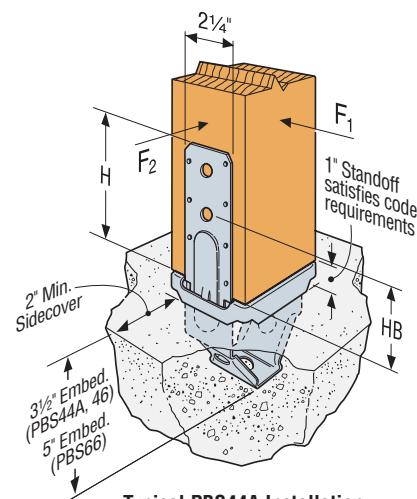

- Use all specified fasteners. See General Notes.
- Install either nails or bolts (see page 16 note d).
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).
- PB—Holes are provided for installation with either 16d commons or 1/2" bolts for PB66 and PB66R; all other models use 16d commons only. A 2" minimum sidecover is required to obtain the full load.
- PBS—Embed into wet concrete up to the bottom of the 1" standoff base plate. A 2" minimum side cover is required to obtain the full load. Holes in the bottom of the straps allow for free concrete flow.

OPTIONS: PBS available in rough sizes (except for PBS46), contact Simpson Strong-Tie.

CODES: See page 12 for Code Reference Key Chart.

- For higher downloads, solid pack grout under 1" standoff plate before installing PBS into concrete. Base download on column or concrete, according to the code.
- Concrete shall have a minimum compressive strength, $f_c = 2500$ psi.
- Multiply Seismic and Wind ASD load values by 1.4 or 1.6 respectively to obtain LRFD capacities.
- In accordance with IBC Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (*such as fences or unbraced carports*).
- Download shall be reduced where limited by the design capacity of the post.

- See pages 245-246 for common post allowable loads.
- Designer is responsible for concrete design.
- For lateral loads for all PBS models: F_1 allowable = 1165 lbs. when using nails and 230 lbs. when using bolts. F_2 allowable = 835 lbs. when using either nails or bolts.
- Structural composite lumber columns have sides that either show the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See Technical Bulletin T-C-SCLCLM for load reductions due to narrow face installations.
- NAILS:** 16d = 0.162" dia. x 3 $\frac{1}{2}$ " long. See pages 22-23 for other nail sizes and information.

EPS4Z Post Bases

The EPS4Z provides a light-duty connector for attachment of posts to concrete.

MATERIAL: 14 gauge

FINISH: ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

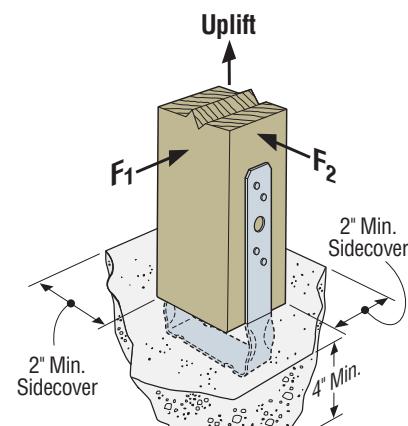

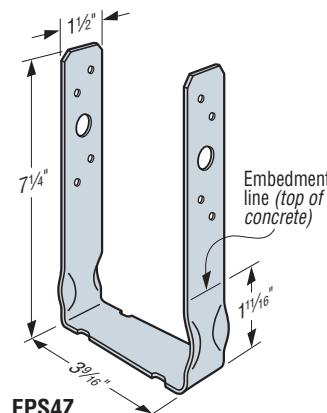

- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (*such as fences or unbraced carports*).
- Embed into wet concrete up to the embedment line. A 2" minimum side cover is required to obtain the full load.
- Posts shall be preservative-treated wood to meet building code requirements.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Typical EPS4Z Installation

CBS/CBSQ Column Bases

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The CBS column base installs with machine bolts and provides tested capacity. The 1" standoff (included) meets code requirements for structural posts installed in basements or exposed to weather or water splash. The CBSQ uses Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws, which allow for fast installation, reduced reveal and high capacity, provides a greater net section area of the column compared to bolts.

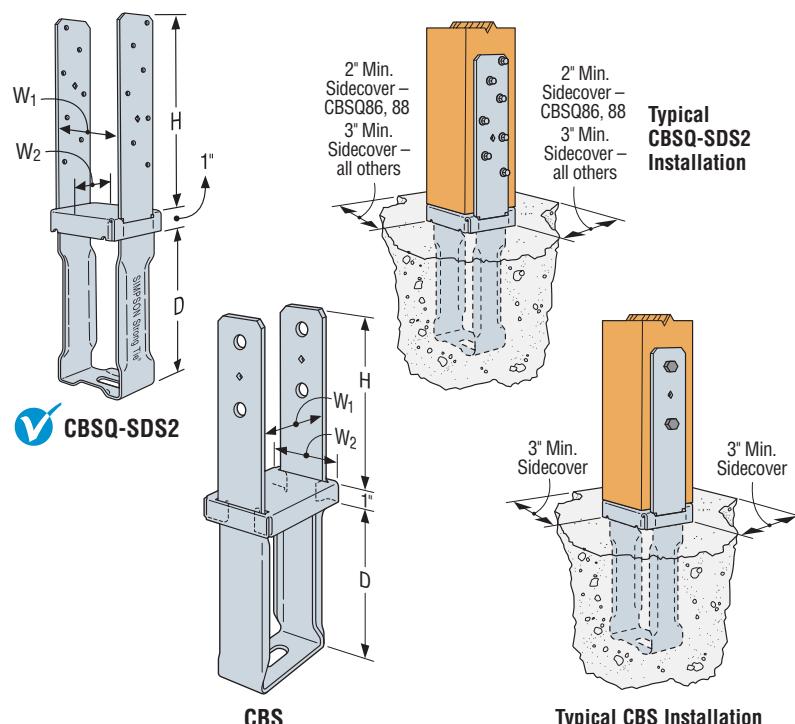

MATERIAL: See table **FINISH:** Galvanized, available in HDG
INSTALLATION: • Use all specified fasteners.

See General Notes.

- For CBS, install with two machine bolts.
- For CBSQ, install 1/4" x 2" Strong-Drive SDS Heavy-Duty Connector screws, which are provided with the column base. (Lag screws will not achieve the same load.)
- For full loads, a minimum of 3" side cover shall be provided.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).

ORDERING: To order the CBSQ with screws, specify CBSQ-SDS2.
To order without screws, specify CBSQ.

CODES: See page 12 for Code Reference Key Chart.

Typical CBS Installation

1. Loads may not be increased by short-term loading.
2. For higher downloads, solid pack grout under 1" standoff plate before installing CBS or CBSQ into concrete. Base download on column or concrete, according to the code.
3. Concrete shall have a minimum compressive strength, f'_c = 2500 psi.
4. Multiply Seismic and Wind ASD load values by 1.4 or 1.6 respectively to obtain LRFD capacities.
5. In accordance with IBC Section 1613.1, detached one- and two-family dwellings in

6. Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
7. Download shall be reduced where limited by the design capacity of the column. See pages 245-246 for common post allowable loads.
8. Designer is responsible for concrete design.
9. Structural composite lumber columns have sides that either show the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See Technical Bulletin T-C-SCLCLM for load reductions due to narrow face installations.

LCB/CB Column Bases**MATERIAL:** See table**FINISH:** LCB, CB44, CB46, CB48, CB66, CB68, CB610—galvanized; all other CB—Simpson Strong-Tie® gray paint or HDG.

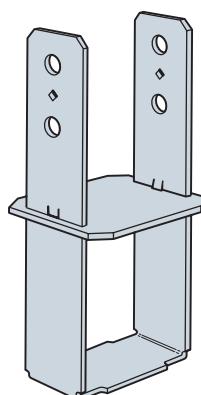

Some models available in HDG or stainless steel

INSTALLATION: • Use all specified fasteners. See General Notes.

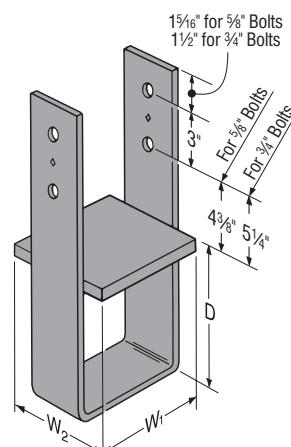

- For full loads, minimum side cover required is 3" for CB, 2" for LCB.
- Install all models with bottom of base plate flush with concrete.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).

OPTIONS:

- LCB and CB are available in rough size. Other sizes available for CB specify W₁ and W₂ dimensions. Consult Simpson Strong-Tie for bolt sizes and allowable loads.

CODES: See page 12 for Code Reference Key Chart.**CB44**

1. Loads may not be increased for short-term loading.
2. Concrete shall have a minimum compressive strength, f_c = 2500 psi.
3. LCB products may be installed with either bolts OR nails (not both) to achieve table loads.
4. Multiply Seismic and Wind ASD load values by 1.4 or 1.6 respectively to obtain LRFD capacities.
5. In accordance with IBC Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
6. Download capacity shall be based on either the wood post design or concrete design calculated per code. See pages 245-246 for common post allowable loads.
7. Designer is responsible for concrete design. Minimum foundation dimensions are for anchorage only.
8. Loads must not be increased by short-term loading.
9. **NAILS:** 16d = 0.162" dia. x 3 1/2" long. See pages 22-23 for other nail sizes and information.

PPBZ Porch Post Base

The PPBZ porch base offers a simplified, one-time installation designed to support permanent porch framing throughout all stages of construction. This design eliminates the need for temporary vertical support and streamlines the subcontractor scheduling process while still providing adequate safety to enable full access for installers/inspectors.

The porch post base is fastened to the footing with two Simpson Strong-Tie® Titon® masonry screws when framing the porch roof. Then, when the time is right, the concrete contractor is able to complete the last phase of the porch slab without the interference of temporary vertical support and without the framer having to return to the jobsite after the slab has hardened. Designed to withstand vertical construction loads prior to embedment in concrete, the PPBZ will support the weight of most framed porches and overhangs.

FEATURES:

- Stiffened embedded side stirrups provide temporary vertical download support without being embedded into concrete
- 1" stand-off reduces the potential for decay at post or column ends
- Two available sizes provide both 4" and 6" slab thicknesses
- Pre-pour installation eliminates temporary support
- No disruption in scheduling
- Eliminates additional move-ins by trades and certain inspection call backs

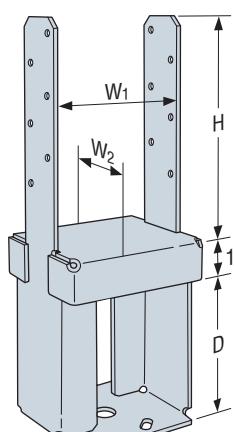

MATERIAL: See table

FINISH: ZMAX® coating

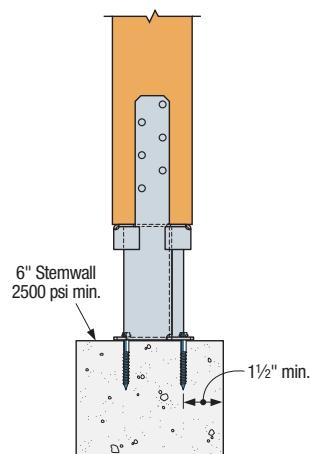

INSTALLATION: • Use all specified fasteners. See General Notes.

- Locate and place PPBZ on footing according to framing plans
- Secure PPBZ to footing with 2 - (1/4" dia. x 1 1/4" long hex head) Titon® concrete screws located a minimum of 1 1/2" from the edge of concrete.
- Attach 4x4 post to PPBZ using 12-10d common (0.148" dia. x 3" long) nails. After bracing the top and bottom of the post from lateral movement, the post may then be loaded in download or uplift.
- When ready, pour concrete porch slab (4" or 6") up to the bottom of the stand-off base while maintaining minimum 1" concrete side coverage.

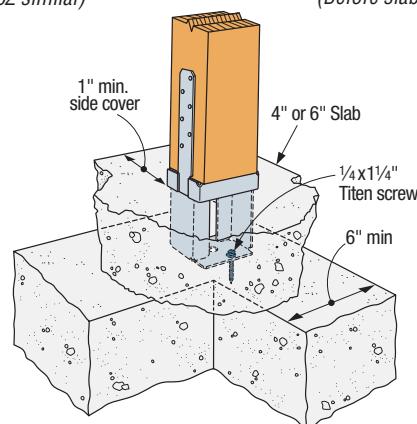

CODES: See page 12 for Code Reference Key Chart.

1. Loads may not be increased for short-term loading.
2. Concrete shall have a minimum compressive strength, $f'_c = 2500$ psi.
3. Multiply Seismic and Wind ASD load values by 1.4 or 1.6 respectively to obtain LRFD capacities.
4. In accordance with IBC Section 1613.1, detached one- and two-family dwellings in Seismic Design Category (SDC) C may use "Wind and SDC A&B" allowable loads.
5. Download shall be reduced where limited by the design capacity of the post.
See pages 245-246 for common post allowable loads.
6. Designer is responsible for concrete design.
7. For full loads, nearest concrete edge required is 4" from PPBZ center line.
8. Structural composite lumber columns have sides that either show the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face.
See Technical Bulletin T-C-SCLCLM for load reductions due to narrow face installations.
9. NAILS: 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

Caps & Bases

BC/BCS Post Caps

The BCS allows for the connection of 2-2x's to a 4x post or 3-2x's to a 6x post. Double shear nailing between beam and post gives added strength. The BC series offers dual purpose post cap/base for light cap or base connections.

MATERIAL: 18 gauge **FINISH:** Galvanized. Some products available in ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

- Do not install bolts into pilot holes.
- BCS: install dome nails on beam; drive nails at an angle through the beam into the post below to achieve the table loads.
- BC: install with 16d commons or 16dx2½" joist hanger nails.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (*such as fences or unbraced carports*).
- To tie multiple 2x members together, the Designer must determine the fasteners required to join members to act as one unit without splitting the wood.

CODES: See page 12 for Code Reference Key Chart.

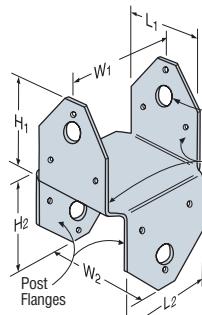

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

LCC Lally Column Caps / CCOS Steel Column Caps

Lally column caps and steel column caps provide adequate bearing length for larger girder reactions.

MATERIAL: LCC—12 gauge; CCOS—7 gauge **FINISH:** LCC—Simpson Strong-Tie® gray paint; CCOS—G90 Galvanized

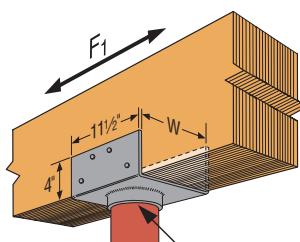

INSTALLATION: • Use all specified fasteners. See General Notes.

- LCC—Fit the lally column cap over the lally column and attach to the girder.
- CCOS—Attach steel column cap to column end plate with (4) Simpson Strong-Tie Quik Drive® XQ112S1224 self-tapping screws (*provided*) and attach to girder. Install with ½" hex driver. See fier F-CCOS for additional CCOS applications.

3½" diameter (O.D.) steel column

Typical CCOS5.50 Installation
connecting a 3-ply LVL
and a steel column

1. Loads may not be increased for short-term load.
2. Allowable loads are determined using the lowest of the bearing loads using F_c-perp equal to 425 psi for SPF, 625 psi for DF and 700 psi for PSL/PSL/LSL.
3. Loads are for a continuous beam.
4. Spliced conditions for the LCC must be detailed by the Designer to transfer tension loads between spliced members by means other than the lally column. The splice condition load is 6750 lbs per beam side for LCC must be evenly loaded.
5. To achieve lateral loads, the LCC pipe must be welded to the

6. The CCOS must be attached to the column cap plate with (4) Quik Drive XQ112S1224 self-tapping screws through the end plate and into the bottom of the CCOS. Max column cap plate thickness = ½". CCOS minimum column diameter is 3".
8. CCOS caps can resist out-of-plane (F₂) forces up to 2200 lbs. provided the beam is braced to resist torsional rotation.
9. **NAILS:** 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

AC/ACE/LPCZ/LCE/RTC Post Caps

The LCE4's universal design provides high capacity while eliminating the need for rights and lefts. For use with 4x or 6x lumber. LPCZ—Adjustable design allows greater connection versatility. MATERIAL: LCE4—20 gauge; AC, ACE, LPC4Z—18 gauge; LPC6Z—16 gauge; RTC—14 gauge FINISH: Galvanized. Some products available in ZMAX® coating and stainless steel; see Corrosion Information, pages 13–15.

INSTALLATION: • Use all specified fasteners. See General Notes.

- Install all models in pairs. LPCZ—2½" beams may be used if 10dx1½" nails are substituted for 10d commons.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

Model No.	Dimensions		Total No. Fasteners		Allowable Loads (DF/SP) (160) ¹		Code Ref.

1. Allowable loads have been increased for wind or earthquake with no further increase allowed; reduce where other loads govern.
2. Loads apply only when used in pairs.
3. LPCZ lateral load is in the direction parallel to the beam.
4. MIN nailing quantity and load values—fill all round holes;
MAX nailing quantities and load values—fill round and triangle holes.
5. Uplift loads do not apply to splice conditions.
6. Spliced conditions must be detailed by the Designer to transfer tension loads between spliced members by means other than the post cap.
7. LCE4 uplift load for mitered corner conditions is 985 lbs. (DF/SP) or 845 lbs. (SPF).
Lateral loads do not apply.
8. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge).
9. **NAILS:** 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long.
See pages 22–23 for other nail sizes and information.

Model No.	Dimensions (in.)		Total No. of Fasteners		DF/SP Uplift Loads		SPF Uplift Loads
			Beam	Post	Total Uplift	(160)	
	W	L	Side Beam	Main Beam	Total	(160)	
LCE4Z (Mitered Corner)	5%	5%	(14) 16d	(10) 16d	985		845

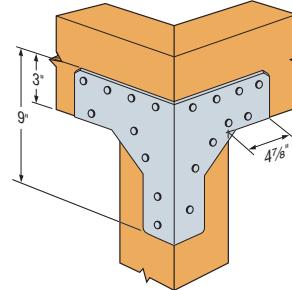

1. The allowable download for the mitered LCE4 connection is limited to bearing of the mitered section on the post and shall be determined by the Designer.
2. Connectors must be installed in pairs to achieve listed loads.

Model No.	Dimensions (in.)		Total No. of Fasteners		DF/SP Uplift Loads			SPF Uplift Loads		
			Beam	Post	Side Beam	Main Beam	Total	Side Beam	Main Beam	Total
RTC44 ¹ (Mitered Corner)	3½"	4¾	(16) 16d	(10) 16d	900	900	1800	775	775	1550
RTC44 ² (Square Cut)	3½"	4¾	(16) 16d	(10) 16d	925	1230	1760	795	1060	1515

1. The allowable download for the mitered RTC44 connection is limited to bearing of the mitered beams on the post and shall be determined by the Designer.
2. The allowable download for the main beam in the square cut RTC44 connection is limited to bearing of the beam on the post and shall be determined by the Designer. The side beam allowable download is 1170 lbs.
3. The combined uplift loads applied to all beams in the connector must not exceed the total allowable uplift load listed in the table.

RTC44 Installation

RTC44 Installation
(Mitered Corner)

PCZ/EPCZ Post Caps

The next-generation PCZ/EPCZ post caps are designed with their post and beam flanges in-line so that one PCZ/EPCZ model can accommodate several post sizes. The PCZ/EPCZ now uses easier-to-install 10d common nails. An alternate choice of fasteners is Strong-Drive® #9x1½" SD Connector screws. ZMAX® finish is standard to meet exposure conditions in many environments. See additional corrosion information at www.strongtie.com/info.

MATERIAL: 16 gauge

FINISH: ZMAX coating

INSTALLATION:

- Use all specified fasteners; see General Notes.
- Do not install bolts into pilot holes.

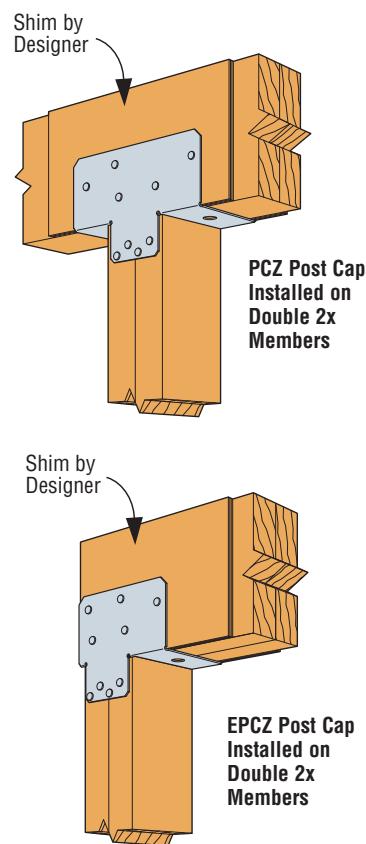

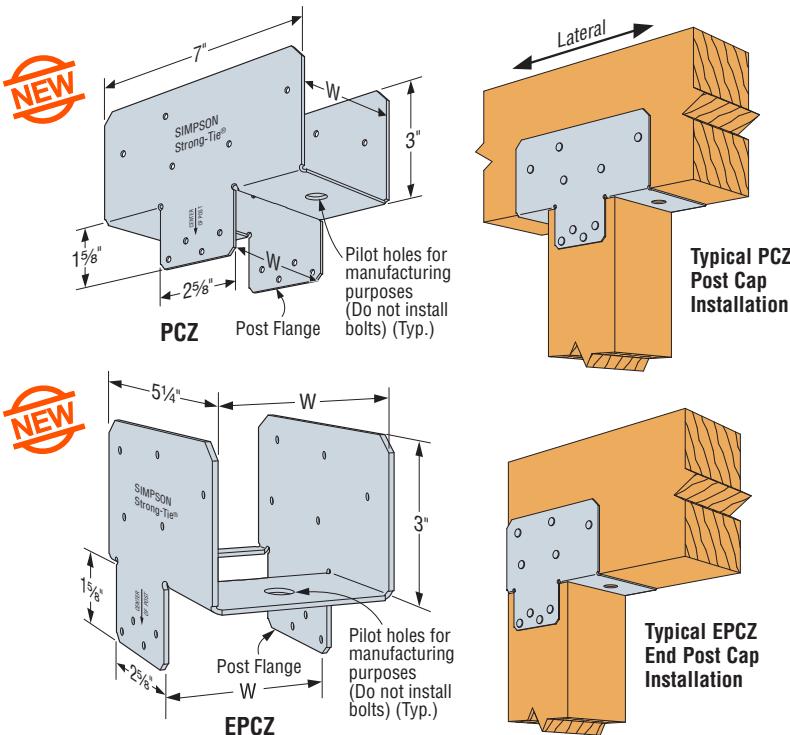

OPTIONS:

- For end conditions, specify EPCZ post caps.
- For heavy-duty applications, see CCQ and CC Series.
- For retrofit applications, see AC and LC Series.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

				6x8	1480	1295	1435	1230			
				8x8	1480	1380	1435	1230			

1. Allowable loads have increased for wind or earthquake with no further increase allowed; reduce where other loads govern.
 2. Uplift loads do not apply to spliced conditions. Spliced conditions must be detailed by the Designer to transfer tension loads between spliced members by means other than the post cap.
 3. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face and do not allow for installation into the narrow face.
 4. Post and beam may consist of multiple members provided they are connected independently of the post cap fasteners.
 5. 10d×2½ (0.148" dia. x 2½" long) nails may be used with no load reduction for uplift and 0.85 of the table loads for lateral.
 6. Strong-Drive® SD9x1½ Connector screws may be substituted for table fasteners with no load reduction.
 7. Models available for rough size lumber, specify RZ suffix. Ex. PC4RZ.
 8. **NAILS:** 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.
- SCREWS:** SD9112 = 0.131" dia. x 1½" long.

CCQ/ECCQ Column Caps

**This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.**

Column caps provide a high-capacity connection for column-beam combinations. This design uses Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws to provide faster installation and provides a greater net section area of the column compared to bolts. The SDS screws provide for a lower profile compared to standard through bolts.

MATERIAL: CCQ3, ECCQ3, CCQ4, CCQ4.62, ECCQ4, ECCQ4.62, CCQ6,

ECCQ6—7 gauge; all others—3 gauge

FINISH: Simpson Strong-Tie® gray paint, available in HDG;

CCQ and ECCQ—no coating

INSTALLATION:

- Install $\frac{1}{4}'' \times 2\frac{1}{2}''$ Strong-Drive SDS Heavy-Duty Connector screws, which are provided with the column cap. (Lag screws will not achieve the same load.)
- CCQ and ECCQ column cap only (no straps) may be ordered for field-welding to pipe or other columns. Dimensions are same as CCQ and ECCQ.
- For rough cut lumber sizes, provide dimensions. An optional W_2 dimension may be specified with any column size given. (Note that the W_2 dimension on straps rotated 90° is limited by the W_1 dimension.)

OPTIONS:

- For end conditions, specify ECCQ.
- Straps may be rotated 90° where $W_1 \geq W_2$ and for CCQ5-6.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Uplift loads have been increased for wind or earthquake with no further increase allowed; reduce where other loads govern.

2. Down loads may not be increased for short-term loading and shall not exceed the post capacity.

See pages 245–246 for common post allowable loads.

3. Uplift loads do not apply to splice conditions.

4. Spliced conditions must be detailed by the Designer to transfer tension loads between spliced members by means other than the column cap.

5. Column sides are assumed to lie in the same vertical plane as the beam sides. CCQ4.62 models assume a minimum 3 $\frac{1}{2}$ " wide post.

6. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers.

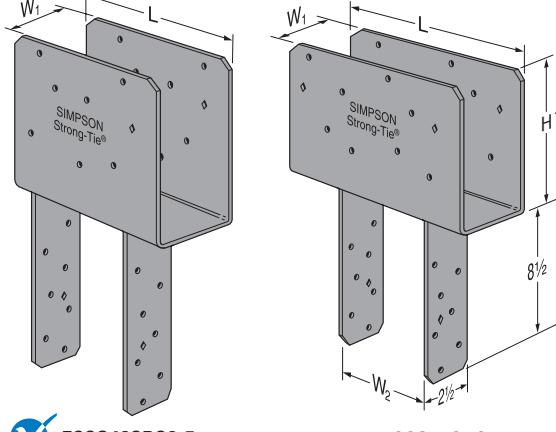

Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge).

7. ECCQ uses 14 Strong-Drive® SDS Heavy-Duty Connector screws into the beam and 14 Strong-Drive SDS Heavy-Duty Connector screws into the post.

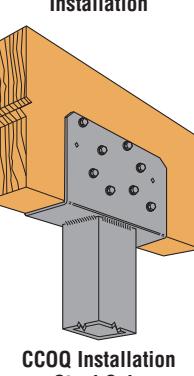

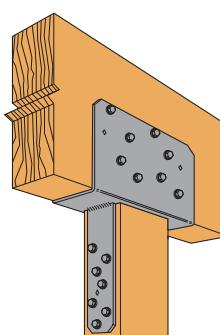

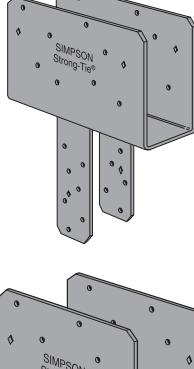

8. Beam depth must be a minimum 7".

9. For 5 $\frac{1}{2}$ " engineered lumber, use 5 $\frac{1}{2}$ " models.

10. CCQ and ECCQ welded to steel column will achieve same load as CCQ and ECCQ. Steel column width shall not be less than beam width. Weld by Designer.

Optional CCQ with straps rotated 90°

CC/ECC/ECCU Column Caps

Column caps provide a high-capacity connection for column-beam combinations.
MATERIAL: CC3 $\frac{1}{4}$, CC44, CC46, CC48, CC4.62, CC64, CC66, CC68, CC6-7 $\frac{1}{8}$, ECC3 $\frac{1}{4}$, ECC44, ECC46, ECC48, ECC4.62, ECC64, ECC66, ECC68, ECC6-7 $\frac{1}{8}$ —7 gauge; all others—3 gauge

FINISH: Simpson Strong-Tie® gray paint; may be ordered HDG; CCO, ECCO—no coating
INSTALLATION: • Use all specified fasteners. See General Notes.

- Bolt holes shall be a minimum of $\frac{1}{32}$ " to a maximum of $\frac{1}{16}$ " larger than the bolt diameter (per 2005 NDS, section 11.1.2).

- Contact engineered wood manufacturers for connections that are not through the wide face.

OPTIONS: • Straps may be rotated 90° where $W_1 \geq W_2$ (see illustration) and for CC5 $\frac{1}{4}$ -6.

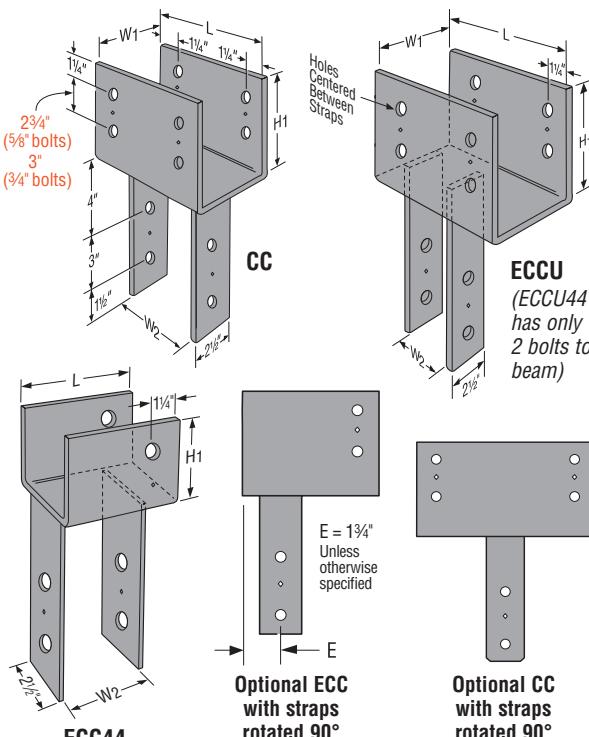

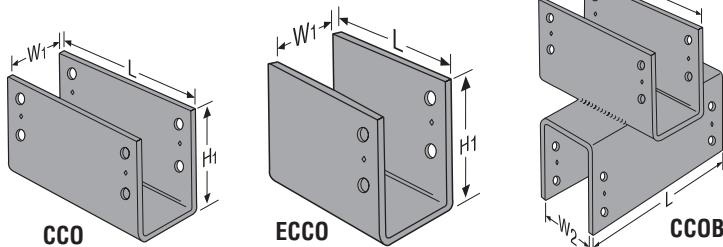

- For special, custom, or rough cut lumber sizes, provide dimensions.

An optional W_2 dimension may be specified. (The W_2 dimension on straps rotated 90° is limited by the W_1 dimension.)

- CCO/ECCO**—Column cap only (no straps) may be ordered for field-welding to pipe or other columns. CCO/ECCO dimensions are the same as CC/ECC.

CCOB—Any two CCOs may be specified for back-to-back welding to create a cross beam connector. Use the table loads; the load is no greater than the lesser element employed.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- Uplift loads have been increased for wind or earthquake with no further increase allowed; reduce where other loads govern.
- Down loads may not be increased for short-term loading and shall not exceed the post capacity. See pages 245-246 for common post allowable loads.
- CC uplift loads do not apply to splice conditions.
- Splice conditions with CCs must be detailed by the Designer to transfer tension loads between spliced members by means other than the column cap.
- Column sides are assumed to lie in the same vertical plane as the beam sides. CC4.62 models assume a minimum 3 $\frac{1}{2}$ " wide post.

- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge).
- Beam depth must be at least as tall as H_1 .
- For 5 $\frac{1}{4}$ " engineered lumber, use 5 $\frac{1}{2}$ " models.
- CCO and ECCO welded to steel column will achieve same load as CC and ECC. Steel column width shall not be less than beam width. Weld by Designer.

ECCLQ/CCCQ/CCTQ Column Caps

The ECCLQ, CCCQ and CCTQ column caps provide high-capacity, multiple beam-to-column connector options. The design uses Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws to provide faster installation and a lower profile compared to standard through bolts. Screws are configured to provide high uplift design values.

MATERIAL: 7 gauge

FINISH: Simpson Strong-Tie® gray paint, also available in HDG

INSTALLATION:

- Install $\frac{1}{4}'' \times 2\frac{1}{2}''$ Strong-Drive SDS Heavy-Duty Connector screws, which are provided, in all round holes. (*Lag screws will not achieve the same load.*)
- No additional welding is allowed.

OPTIONS:

- Many combinations of beam and post sizes can be manufactured (refer to worksheet T-CCQLTC-WS).
- Available in widths up to 8" wide.
- ECCLQ is available in left or right side beam orientations. Specify ECCLLQ or ECCLRQ.
- Straps may be rotated where $W_1 > W_2$.
- Column caps may be ordered without the column straps for field welding to a column. No loads apply. Specify CCCQ/Q/CCTQ/ECCLOQ.

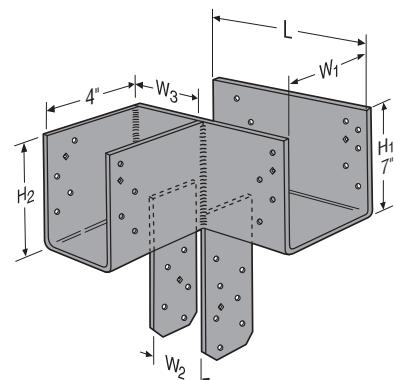

ORDERING:

- The L dimension varies depending on the width of the side stirrup (W_3 or W_4). Contact Simpson Strong-Tie for exact dimensions.
- Main beam stirrup height (H_1) is 7". Side beam stirrups (H_2 or H_3) can vary in height with the minimum height of 7". Specify the side stirrup height from the top of the cap.
- Example Order: 4x Main Beam, 6x Post, 4x Side Beam (*oriented to the left*) is ordered as an ECCLLQ464SDS

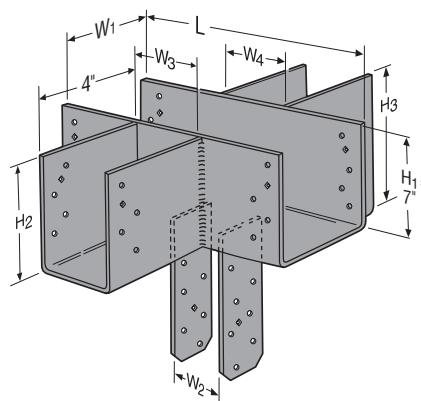

CODES: See page 12 for Code Reference Key Chart.

Series	Allowable Loads (DF/SP)					Code Ref.	
	Uplift (160)			Download (100)			
	Main Beam	Side Beam	Total ³	Side Beam	Total		
ECCLQ-SDS2.5	2835	1840	3795	6780	Refer to note #5	F24	
CCCQ-SDS2.5	4780	2390 ²	4780	7000			
CCTQ-SDS2.5	4910	2350	5315	7000			

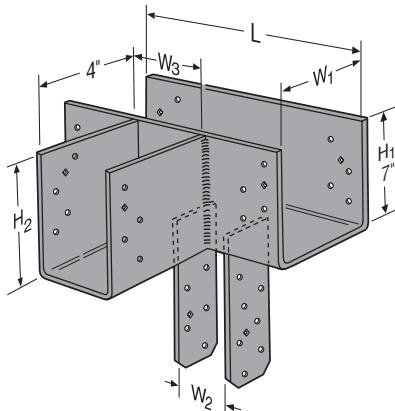

1. Uplift loads have been increased for wind or seismic; reduce where other loads govern. Downloads may not be increased.
2. Allowable load is per seat. Side beams must be loaded symmetrically for the CCCQ.
3. The combined uplift loads applied to all beams in the connector must not exceed the total allowable uplift load listed in the table.
4. The ECCLQ side beam may use a side beam uplift load up to 2350 lbs. The deflection of this load may exceed the standard $\frac{1}{6}$ " deflection by an additional $\frac{1}{6}$ ".
5. The combined download for all of the carried beams shall not exceed the allowable download for the unmodified product on page 68 (CCQ load for CCCQ and CCTQ, or ECCQ load for ECCLQ). The download for each side beam shall not exceed the lesser of 35% of the allowable download or 9265 lbs. for the unmodified product.
6. The download to each side beam shall not exceed the allowable load shown, nor 35% of the allowable load for the unmodified product, whichever is lower.
7. Column width in the direction of the beam width must be the same as the main beam width (W_1).

ECCLLQ-SDS2.5

Order ECCLRQ-SDS2.5 for right direction

CCCO-Q-SDS2.5

CCTQ-SDS2.5

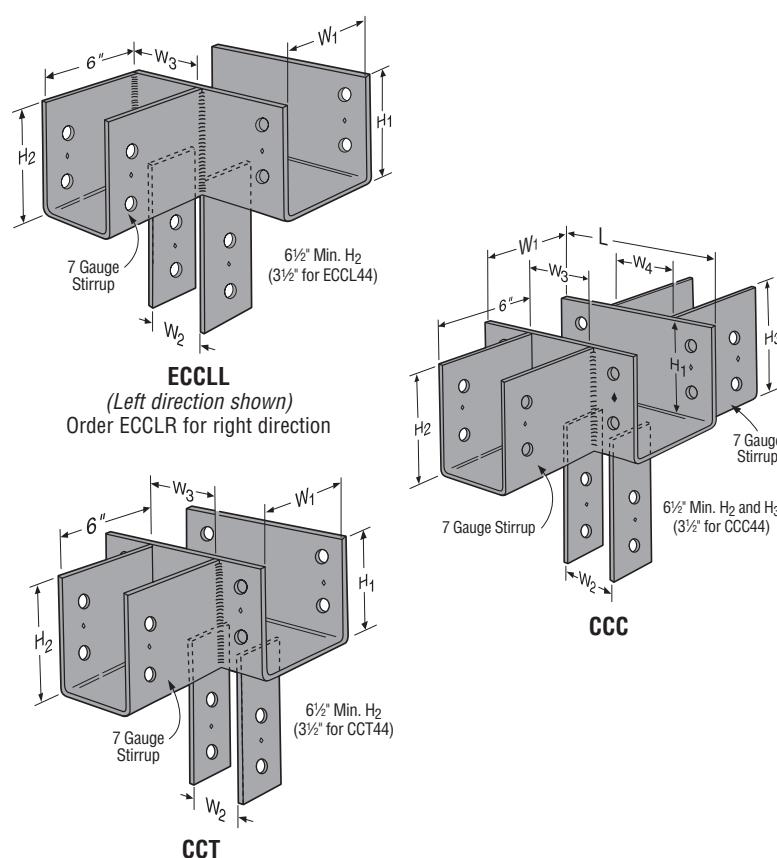

ECCL/CCC/CCT Column Caps

Column-to-beam connections often have multiple beams framing on top of a column. L, T, and cross-column caps provide design solutions for this application. Many combinations of beam and post sizes can be manufactured (*refer to worksheet T-CCLTC-WS for details*) with the following criteria applied:

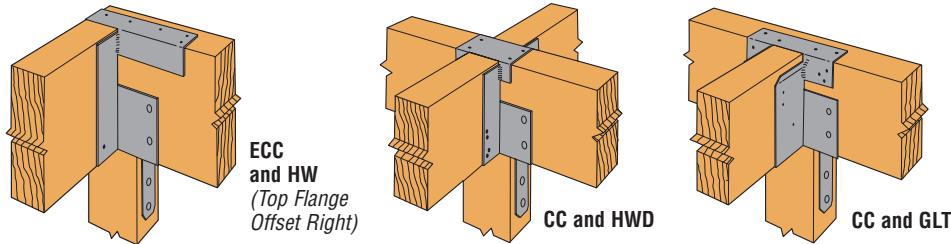

- The download capacity shall be determined from the capacity for the unmodified product (*see page 69*). The side beam can take a maximum of 40% of the download and shall not exceed 10,665 lbs. The sum of the loads for the side beam(s) and main beam can not exceed the table load.
- Uplift loads do not apply for ECCL caps. For CCC and CCT, uplift loads from table apply for main beam only.
- The column width in the direction of the main beam width must be the same as the main beam width (W_1).
- Specify the stirrup height from the top of the cap. The minimum side stirrup heights (H_2 or H_3) is $6\frac{1}{2}$ " ($3\frac{1}{2}$ " for 44s).
- The L dimension may vary depending on the width of the side stirrup (W_3 or W_4).
- Column caps may be ordered without the column straps for field welding to a column. No loads apply. Specify CCOC/CCOT/ECCOL.

Ordering Examples:

- A CCC66 with $W_3 = 5\frac{1}{2}$ ", H_2 and $H_3 = 6\frac{1}{2}$ " is a CC66 column cap with $5\frac{1}{2}$ " beams on each side with all beam seats flush.
- An ECCLR66 with $W_3 = 3\frac{5}{8}$ ", $H_2 = 7\frac{1}{2}$ " is an ECC66 end column cap with a 4x beam on the right side (*specify direction left (which is shown) or right for stirrup*) and stirrup seat 1" below the cap seat.

There are cost-effective alternatives for replacing column caps by using a combination of connectors. Designer must specify the options required.

**Ordering Multiple-Beam Column Caps**

Ordering bolted column caps incorporate several key steps that are important to ensure the highest-capacity capacity solution for your project. Here are some common steps to begin that process. For more information, refer to worksheet T-CCLTC-WS for bolted connections and worksheet T-CCQLTC for Quick Install connections. See page 2 of these worksheets for model numbers for common post and beam width combinations. These worksheets are available at www.strongtie.com.

- 1. Choose Column Cap Style.** Look at the configuration of the column caps to determine which style column cap you require. If you don't know which style column cap is required, refer to your plans to determine the correct configuration.
- 2. Determine Column Cap Dimensions.** Fill in the dimensions of the column cap on the worksheet. If you don't know the dimensions of the column cap, go directly to the "Post and Beam Dimensions" section.
- 3. Provide Beam and Post Dimensions.** The "Post and Beam Dimensions" section of this worksheet is required. Fill in all applicable dimensions in actual inches, not as nominal dimensions.
- 4. Determine Beam Orientation.** Refer to your plans or check the configuration of the column cap you selected in order to determine the orientation of the beam. Check the box for the beam orientation that best describes your beam configuration: Beam B flush at bottom of Beam A; Beam B flush at both the top and bottom of Beam A; or Beam B flush at top of Beam A.
5. Check the box for the required style and strap orientation.
- 6. Select Finish.** Standard finish is Simpson Strong-Tie® gray paint, available in HDG (specify HDG).
- 7. Place Order.** Contact Simpson Strong-Tie for ordering information.

Innovative Solutions

No Company Understands Light-Frame Lateral Systems Better Than Simpson Strong-Tie

That's not bragging. It's the results of thousands of hours of research, development and testing that we put into our products as we consider nearly every application scenario. That knowledge, coupled with our out-in-the-field expertise, ensures that we clearly understand the requirements – and the expectations – of consistently delivering code-listed, cost-effective moment frames, shearwalls and multi-story uplift/overturining restraint solutions.

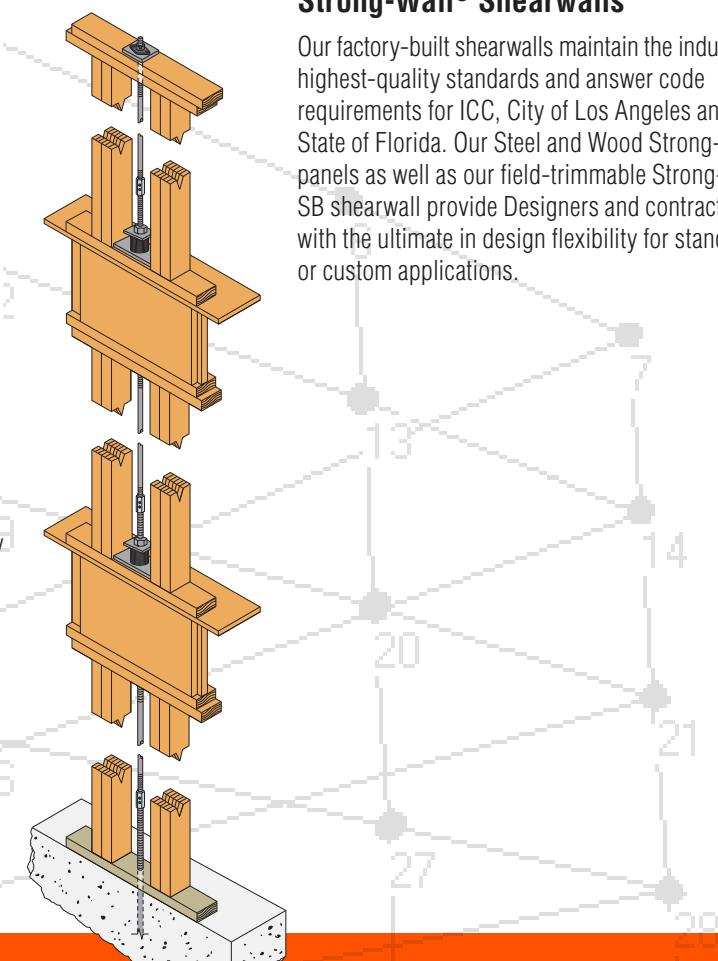

Strong Frame® Moment Frames

When lateral-force resistance is needed for structures with large openings and small wall spaces, Simpson Strong-Tie offers hundreds of Strong Frame moment frame configuration options. By using our latest Strong Frame catalog or Strong Frame Selector software, Designers can pick the configuration that best resists wind or seismic lateral loads for applications, such as soft-story retrofit wood structures or buildings built over tuck-under parking. Designing a multi-bay, multi-story project? We have loading sheets that you can fill out online by visiting www.strongtie.com.

Strong-Rod® Shearwall Overturning and Roof Uplift Restraint Systems

For mid-rise wood construction projects, Simpson Strong-Tie provides the broadest line of continuous rod tie-down system components. With our unmatched experience testing multi-story building performance, no one understands how to resist shearwall overturning and roof uplift restraint better than Simpson Strong-Tie.

Strong-Wall® Shearwalls

Our factory-built shearwalls maintain the industry's highest-quality standards and answer code requirements for ICC, City of Los Angeles and the State of Florida. Our Steel and Wood Strong-Wall panels as well as our field-trimmable Strong-Wall SB shearwall provide Designers and contractors with the ultimate in design flexibility for standard or custom applications.

FACE MOUNT HANGERS LUC/LU/U/HU/HUC Standard Joist Hangers

LUCZ concealed flange hanger available for 2x6, 2x8, 2x10 and 2x12 lumber. Ideal for end of ledger/ header or post conditions, the LUCZ also provides cleaner lines for exposed conditions such as overhead decks.

See Hanger tables on pages 76-83. See Hanger Options on pages 233-243 for hanger modifications, which may result in reduced loads.

LU—Value engineered for strength and economy. Precision-formed—engineered for installation ease and design value.

U—The standard U hanger provides flexibility of joist to header installation. Versatile fastener selection with tested allowable loads.

HU/HUC—Most models have triangle and round holes. To achieve maximum loads, fill both round and triangle holes with common nails. These heavy-duty connectors are designed for schools and other structures requiring additional strength, longevity and safety factors.

MATERIAL: See tables on pages 76-83.

FINISH: Galvanized. Some products available in ZMAX® coating.

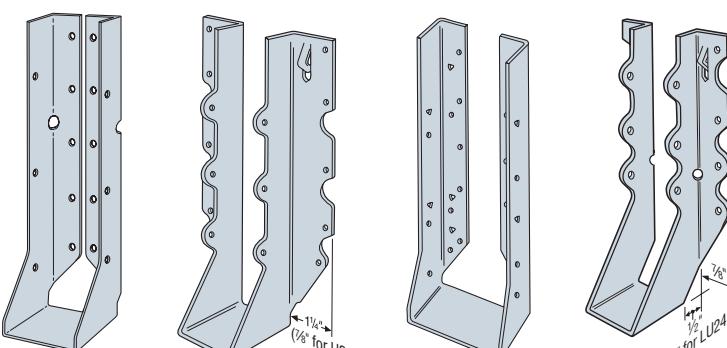

INSTALLATION:

- Use all specified fasteners. See General Notes.
- HU/HUC—Can be installed filling round holes only, or filling round and triangle holes for maximum values.
- Joists sloped up to 1/4:12 achieve table loads.
- For installations to masonry or concrete see page 173.
- HU/HUC hangers can be welded to a steel member. Allowable loads are the lesser of the values in the Hanger tables on pages 76-83 or the weld capacity – refer to technical bulletin T-HUHUC-W.

OPTIONS: • HU is available with one flange concealed when the W dimension is less than 2 $\frac{5}{16}$ " at 100% of the table load. Order HUC_X hanger.

Sloped, Skewed and Sloped/Skewed

- For low-cost, code-listed 45° skews, see SUR/SUL and HSUR/HSUL. See also LSU/LSSU connectors.
- U/HU may be skewed to a maximum of 45° and sloped to a maximum of 45°. Hangers 5 $\frac{1}{2}$ " or less in width may be skewed to 67 $\frac{1}{2}$ °. Hangers skewed 51°- 67 $\frac{1}{2}$ ° require a square cut.
- For all options, uplift loads are 0.75 of table loads.
- For skewed hangers 3 $\frac{3}{16}$ " and less in width, the allowable download is 100% of the table load. For skewed hangers over 3 $\frac{3}{16}$ " in width the allowable download is 80% of the table load. For slope only, the allowable download is 100% of the table load.
- For combined slopes and skews, the maximum allowable download is 0.80 of the table load.
- For sloped and skewed hangers, the flange on the acute side flange can be concealed at 0.80 of the table load. Contact Simpson Strong-Tie for skew limitations.
- See Hanger Options on pages 233-243 for additional information.
- HU only—Rough beam sizes available by special order.
- See page 83 for stocked U hanger rough sizes tables.
- Also see LUS and HUS series.

HUCQ Heavy-Duty Joist Hangers

The HUCQ series are heavy-duty joist hangers that incorporate Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws. Designed and tested for installation at the end of a beam or on a post, they provide a strong connection with fewer fasteners than nailed hangers. See page 117 for structural composite lumber hangers.

MATERIAL: 14 gauge

FINISH: Galvanized. Most models available in stainless steel or ZMAX® coating.

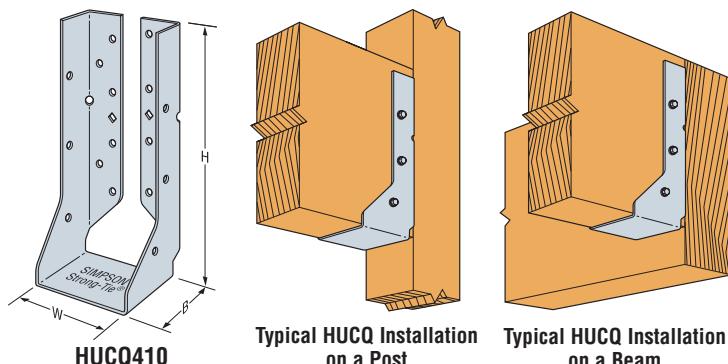

INSTALLATION: • Use all specified fasteners. See General Notes.

- Install $\frac{1}{4}'' \times 2\frac{1}{2}''$ Strong-Drive SDS Heavy-Duty Connector screws, which are provided, in all round holes. (Lag screws will not achieve the same load.)

- For use on solid sawn wood members.

OPTIONS: These hangers cannot be modified.

CODES: See page 12 for Code Reference Key Chart.

1. Uplift loads have been increased for wind or earthquake loading.
Reduce where other loads govern.

2. See page 101 for additional engineered wood product sizes.

3. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge).

LOAD TABLE EXPLANATION

This icon identifies products approved for installation with the Simpson Strong-Tie® Strong-Drive® SD Connector screw. See page 27 for more information.

Min/Max: Refers to min. or max. nailing for products with round and triangle holes. Min. nailing uses round holes, and max. nailing uses round and triangle holes to achieve maximum load.

Load Duration:
Assumed duration factor used to determine the allowable load.

Code Ref.:
See page 12 for the Code Reference Key Chart, to determine which code reports include this product.

Joist Size:
This shows the size of joist member.

Model No.:
This is the Simpson Strong-Tie product name.

Gauge:
Product material

Nails: This shows the fastener quantity and type required to achieve the table loads.

Uplift Floor, Snow, Roof

Installed Cost Index:
This indicates the products relative installed cost (combined cost and installation cost).

This icon identifies products that are available with additional corrosion protection. See pages 13-15 for additional information.

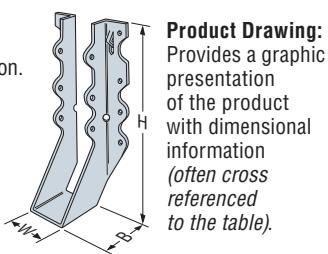

Dimensions W, H, B: This shows the product dimensions (width, height and base in this case,) referenced in the product drawing.

NAILS: $16d = 0.162'' \text{ dia.} \times 3\frac{1}{2}'' \text{ long.}$
 $10dx1\frac{1}{2}'' = 0.148'' \text{ dia.} \times 1\frac{1}{2}'' \text{ long.}$

See pages 22-23 for other nail sizes and information.

Throughout this catalog a footnote will typically be provided indicating the required nail diameter and length.

All installations should be designed only in accordance with the allowable load values set forth in this catalog.

CATALOG DEFINITION:

Deflection: The distance a point moves when a load is applied.

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

See Hanger tables on pages 77-82. See Hanger Options on pages 233-243 for hanger modifications, which may result in reduced loads.

All hangers in this series have double shear nailing. This innovation distributes the load through two points on each joist nail for greater strength. It also allows the use of fewer nails, faster installation, and the use of standard nails for all connections. (Do not bend or remove tabs.)

MATERIAL: See tables, pages 77-82.

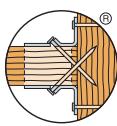

FINISH: Galvanized. Some products available in stainless steel or ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION • Use all specified fasteners. See General Notes.

- Nails must be driven at an angle through the joist or truss into the header to achieve the table loads.
- Not designed for welded or nailer applications.
- 16d sinkers (0.148" dia. x 3 1/4" long) may be used where 10d commons are specified with no reduction in load. Where 16d commons are specified, 10d commons or 16d sinkers (0.148" dia. x 3 1/4" long) may be used at 0.85 of the table load.
- With 3x carrying members, use 16dx2 1/2" nails into the header and 16d commons into the joist with no load reduction.
- With 2x carrying members, use 10dx1 1/2" nails into the header and 10d commons into the joist, reduce the load to 0.64 of the table value.
- Use stainless-steel (SS) nails with stainless-steel (SS) hangers.

OPTIONS: • LUS hangers cannot be modified.

- HUS hangers available with the header flanges turned in for 2-2x (3 1/4") and 4x only, with no load reduction. See the HUSC Concealed Flange illustration.

- Uplift loads apply to 10d and 16d header fasteners. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
- 10d commons or 16d sinkers may be used instead of the specified 16d at 0.84 of the table load value.
- 16d sinkers may be used instead of the specified 10d commons with no load reduction. (16d sinkers are not acceptable for HDG applications.)
- MIN nailing quantity and load values—fill all round holes; MAX nailing quantity and load values—fill all round and triangle holes.

- DF/SP loads can be used for SCL that has fastener holding capacity of Doug Fir.
- Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2007. Simpson Strong-Tie® Connector Selector™ Software includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
- NAILS:** 16d = 0.162" dia. x 3¹/₂" long, 10d = 0.148" dia. x 3" long, 10dx1¹/₂ = 0.148" dia. x 1¹/₂" long. See pages 22-23 for other nail sizes and information.

*Hangers do not have an Installed Cost Index.

FACE MOUNT HANGERS – SOLID SAWN LUMBER (SPF/HF)

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

FACE MOUNT HANGERS – SOLID SAWN LUMBER (SPF/HF)

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

1. Uplift loads apply to 10d and 16d header fasteners. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. 10d commons or 16d sinkers may be used instead of the specified 16d at 0.84 of the table load value.
3. 16d sinkers may be used instead of the specified 10d commons with no load reduction. (16d sinkers are not acceptable for HDG applications.)
4. MIN nailing quantity and load values—fill all round holes;
MAX nailing quantity and load values—fill all round and triangle holes.
5. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2007. Simpson Strong-Tie® Connector Selector™ Software includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
6. **NAILS:** 16d = 0.162" dia. x 3¹/₂" long, 10d = 0.148" dia. x 3" long, 10dx1¹/₂ = 0.148" dia. x 1¹/₂" long. See pages 22-23 for other nail sizes and information.

- Uplift loads apply to 10d and 16d header fasteners. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
- 10d commons or 16d sinkers may be used instead of the specified 16d at 0.84 of the table load value.
- 16d sinkers may be used instead of the specified 10d commons with no load reduction.

- DF/SP loads can be used for SCL that has fastener holding capacity of Doug Fir.
- HU's can be ordered in rough sizes at full table loads. Add "X" to the model designation ex: HU28X and specify rough width or height. Maximum width 8".
- NAILS: 16d = 0.162" dia. x 3^{1/2}" long, 10d = 0.148" dia. x 3" long, 10dx1^{1/2} = 0.148" dia. x 1^{1/2}" long. See pages 22-23 for other nail sizes and information.

CODES: See page 12 for Code Reference Key Chart.

TOP FLANGE HANGERS JB/JBA/LB/LBAZ/BA/B/HHB

Joist, Beam and Purlin Hangers

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The new, next-generation LBAZ and JBA hangers provide higher loads for 2x10, 2x12 and 2x14 members in 14 gauge and 18 gauge steel, respectively. The new nail locations on the JBA enable effective use with nailers.

The B and BA hangers are cost effective hangers featuring min/max joist nailing option. Min Nailing featuring Positive Angle Nailing targets moderate load conditions whereas the Max Nailing generates capacities for higher loads. The unique two level embossment provides added stiffness to the top flange.

See tables on pages 87-91. See Hanger Options on pages 233-243 for hanger modifications, which may result in reduced loads.

MATERIAL: See tables, pages 87-91.

FINISH: BA, JB, **JBA**, LB, **LBAZ** and B—Galvanized; HHB—all saddle hangers and all welded sloped and special hangers—Simpson Strong-Tie® gray paint. BA, LB, B and HHB may be ordered hot-dip galvanized, specify HDG.

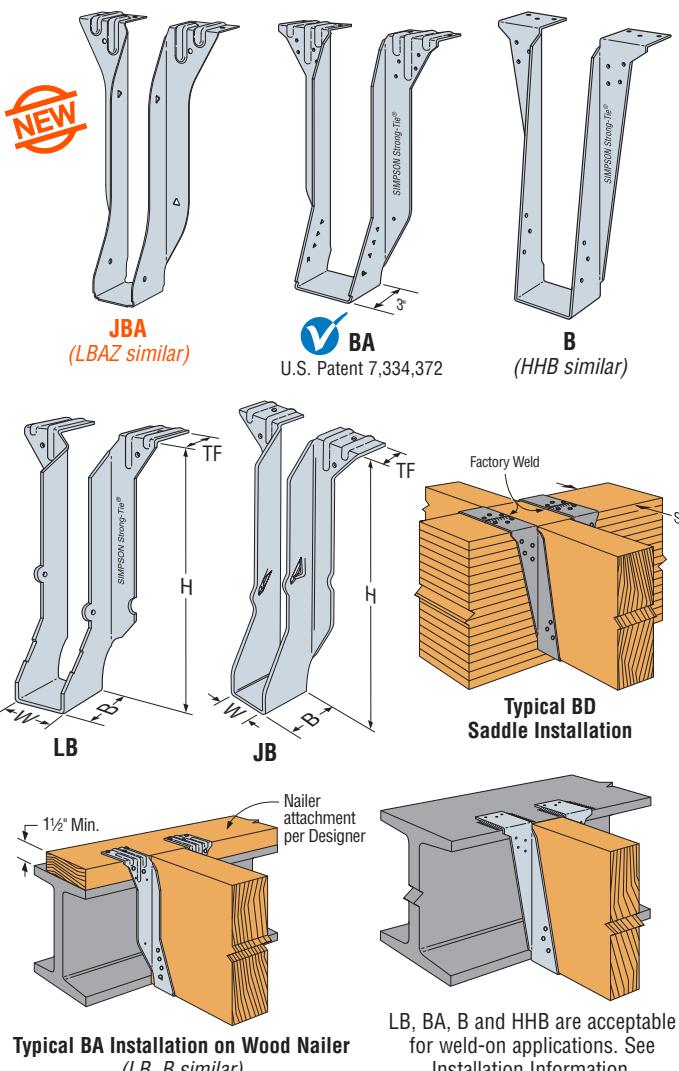

INSTALLATION: • Use specified fasteners. See General Notes and nailer table notes.

- **LBAZ**, BA, B and HHB may also be welded to steel headers with weld size to match material thickness (*approximate thickness shown*). The minimum required weld to the top flanges is $\frac{1}{8}$ " x 2" ($\frac{1}{8}$ " x $1\frac{1}{16}$ " for **LBAZ**) fillet weld to each side of each top flange tab for 14 and 12 gauge and $\frac{3}{16}$ " x 2" fillet weld to each side of each top flange tab for 7 gauge. Distribute the weld equally on both top flanges. Welding cancels the top and face nailing requirements. Consult the code for special considerations when welding galvanized steel. The area should be well-ventilated (*see page 17 for welding information*). Weld on applications produce the maximum allowable down load listed. For uplift loads refer to technical bulletin T-WELDULPLT.
- Ledgers must be evaluated for each application separately. Check TF dimension, nail length and nail location on ledger.
- Refer to technical bulletin T-SLOPEJST for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes ($\leq \frac{3}{4}:12$).

OPTIONS: B and HHB

- Other widths are available; specify W dimension (*the minimum W dimension is $1\frac{1}{16}$ " for B and $3\frac{1}{4}$ " for HHB*).
- See Hanger Options, pages 233-243. BA, JB, **JBA**, LB and **LBAZ** hangers cannot be modified. Use LBV as an alternative for the **JBA/LBAZ**.

CODES: See page 12 for Code Reference Key Chart.

LB, BA, B and HHB are acceptable for weld-on applications. See Installation Information.

Nailer Table⁵

Model No.	Nailer	Top Flange Nailing	Joist Nailing	Allowable Loads		
				Uplift ¹ (160)	DF/SP	SPF/HF
JB210A	2x	6-10dx1½	2-10dx1½	315	1265	965
JB212A	3x	6-16dx2½	2-10dx1½	315	1290	—
LB26	2x	4-10dx1½	2-10dx1½	—	850	—
LB28	2x	4-10dx1½	2-10dx1½	—	915	—
LB210AZ	2x	6-10dx1½	2-10dx1½	375	1265	1065
LB212AZ	3x	6-16dx2½	2-10dx1½	375	1290	—
LB216	2x	4-10dx1½	2-10dx1½	—	1150	—
BA	2x	10-10dx1½	2-10dx1½	265 ³	2220	1755
	2-2x	14-10d	2-10dx1½	265 ³	2695	2235
	3x	14-16dx2½	2-10dx1½	265 ³	3230	—
	4x	14-16d	2-10dx1½	265 ³	3230	—
B	2-2x	14-10d	6-10dx1½	710 ⁴	3615	2770
	3x	14-16dx2½	6-10dx1½	830 ⁴	3725	—
	4x	14-16d	6-10dx1½	830 ⁴	3800	—

1. Uplift values are for DF/SP nailers only. Refer to technical bulletin T-NAILERULPLT for SPF values.
2. For joist members $2\frac{1}{2}$ " or wider, 16dx $2\frac{1}{2}$ " joist nails should be installed for additional uplift loads on the 3x and 4x nailer applications of 970 lbs. and 1010 lbs. respectively.
3. If joist nailing is increased to (8)-10dx1½, higher uplift loads are allowed. See technical bulletin T-NAILERULPLT.
4. If joist nailing is increased to (6)-16dx2½, higher uplift loads are allowed for joist members at least $2\frac{1}{2}$ " wide. See technical bulletin T-NAILERULPLT.
5. Attachment of nailer to supporting member is by the Designer.

	BA Max.						16-10d	2-10dx1 $\frac{1}{2}$	265	4015	3705	3435	2665	
							16-16d	2-10dx1 $\frac{1}{2}$	1170	3555	3630	3625	2465	
							16-10d	2-10dx1 $\frac{1}{2}$	1170	4715	4320	3800	2665	
3x, 4x	B	12	see pages 87-89	see pages 87-89	2 $\frac{1}{2}$	2 $\frac{1}{2}$	14-16d	6-10dx1 $\frac{1}{2}$	990	3575	3195	3625	2190	
							14-10d	6-10dx1 $\frac{1}{2}$	990	4135	3355	3800	2650	

1. Uplift loads are based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. For SPF use 0.86 x DF/SP uplift load.
3. Where noted for single-ply joist hangers use 6-10dx1 $\frac{1}{2}$ " nails.
4. **NAILS:** 16d = 0.162" dia. x 3 $\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, 10dx1 $\frac{1}{2}$ = 0.148" dia. x 1 $\frac{1}{2}$ " long. See pages 22-23 for other nail sizes and information.

HUTF/HUSTF Heavy Duty and Double Shear Joist Hangers

See dimensions, material, loads on table pages.

HUSTF has the double shear nailing advantage—distributing the joist load through two points on each nail for greater strength.

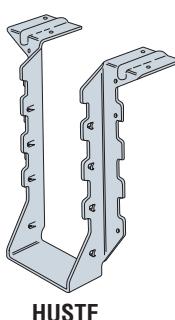

FINISH: Galvanized. See Corrosion Information, pages 13-15.

INSTALLATION:

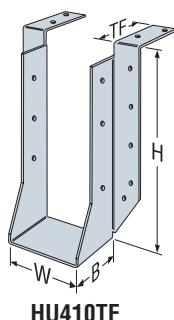

- Use all specified fasteners. See General Notes.
- Not acceptable for nailer or welded applications; see W and B hangers.
- HUTF—The minimum header or ledger size that can be used with this hanger is 3 $\frac{1}{2}$ ".
- HUSTF—With 3x carrying members, use 16dx2 $\frac{1}{2}$ " nails into the header and 16d commons into the joist.

OPTIONS:

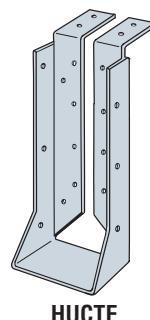

- HUTF rough beam sizes are available by special order.
- See Hanger Options on pages 233-243 for slope and/or skewed hangers.
- Available with flanges turned in (2-2x and 4x only for HUSCTF, 2 $\frac{1}{2}$ " or greater for HUCTF).

HUTF

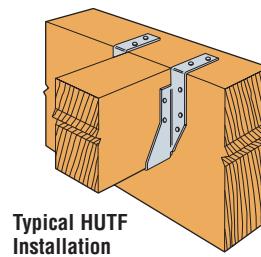

HU410TF

HUCTF

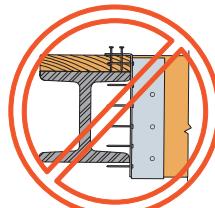

Double Shear Nailing Top View

Typical HUTF Installation

Some model configurations may differ from those shown. Production models have projected seats. Square cut seats may be ordered. Contact Simpson Strong-Tie for details.

Nailer application is NOT acceptable. Fasteners cannot be installed

TOP FLANGE HANGERS W/WPU/WNP/WM/WMU/HW/HWU/GLT/HGLT

The W, WPU, HWU and HW series purlin hangers offer the greatest design flexibility and versatility. WMs are designed for use on standard 8" grouted masonry block wall construction.

MATERIAL: See tables on pages 87-91.

FINISH: Simpson Strong-Tie® gray paint; hot-dip galvanized available; specify HDG, contact Simpson Strong-Tie.

INSTALLATION: • Use all specified fasteners.

- H dimensions are sized to account for normal joist shrinkage. W dimensions are for dressed timber widths.
- Hangers may be welded to steel headers with weld size to match material thickness (*approximate thickness shown*) $\frac{1}{8}$ " for W, $\frac{3}{16}$ " for WNP/WPU and $\frac{1}{4}$ " for HW/HWU, by $1\frac{1}{2}$ " fillet welds located at each end of the top flange (see page 17 for welding information). Weld-on applications produce maximum allowable load listed. For uplift loads refer to technical bulletin T-WELDULPT (*HWU and WPU hangers only*).
- GLT/HGLT may be welded to steel headers, see page 104 for requirements.
- Hangers can support multi-ply carried members; the individual members must be secured together to work as a single unit before installation into the hanger.
- WM—two 16d duplex nails must be installed into the top flange and embedded into the grouted wall. Verify that the grouted wall can take the required fasteners specified in the table.
- Embed WM into block with a minimum of one course above and one course below the top flange with one #5 vertical rebar minimum 24" long in each cell. Minimum grout strength is 2000 psi.

OPTIONS: • Refer to technical bulletin T-SLOPEJST for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes ($\leq 3\frac{1}{2}:12$).

- See Hanger Options, pages 233-243 for hanger modifications and associated load reductions.
- Some model configurations may differ from those shown. Contact Simpson Strong-Tie for details.

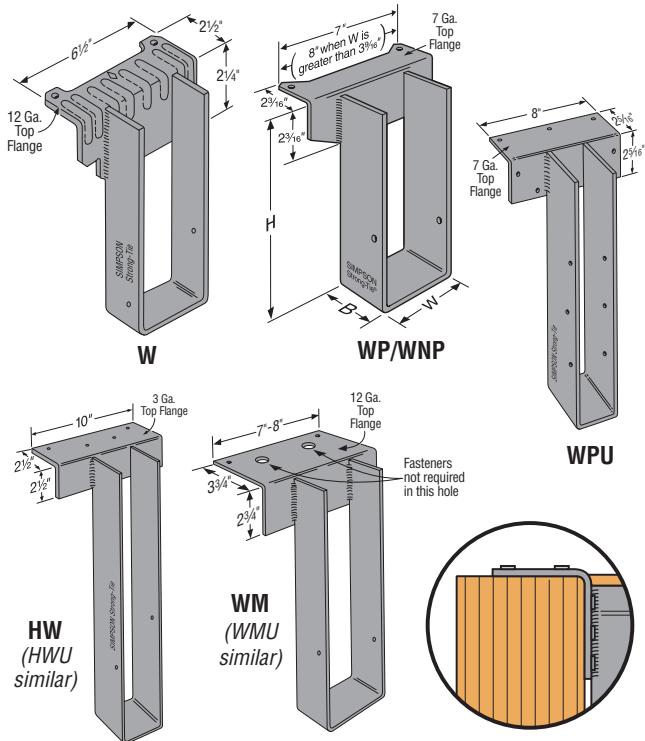

CODES: See page 12 for Code Reference Key Chart.

NAILER TABLE

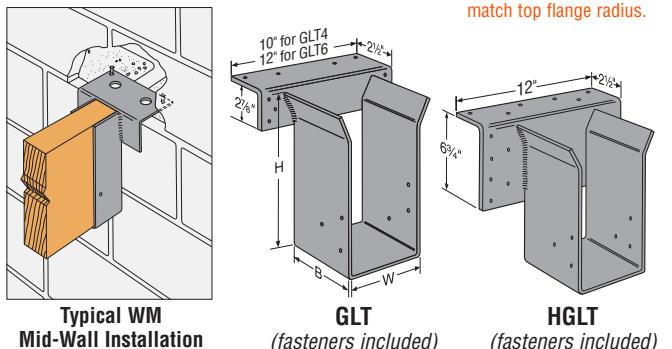

The table indicates the maximum allowable loads for W, WNP and HW hangers used on wood nailers. Nailers are wood members attached to the top of a steel I-beam, concrete or masonry wall.

1. Uplift value for the HWU hanger is for depths $\leq 18"$ and are for DF/SP values only. Refer to uplift values in table below for taller depths.
2. Attachment of nailer to supporting member is the responsibility of the Designer.

Eased Edge

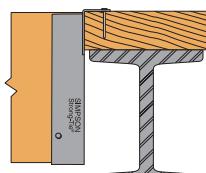

Flatten edge of header to match top flange radius.

GLT (fasteners included) **HGLT** (fasteners included)
See pages 104-105 for GLT and HGLT information.

- Code values are based on DF/SP header species.
- WMU, WPU and HWU uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
- For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.
- Mid-wall Installation requires minimum of one grouted course above and below the hanger.
- NAILS:** 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

1. N54A fasteners are supplied with hangers.

2. 16d sinkers may be used where 10d commons are called out with no load reduction.

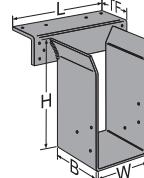

3. Uplift loads are based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed.

For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™ software or conservatively divide the uplift load by 1.6. For SPF use 0.86 x DF/SP uplift load.

4. **NAILS:** 16d = 0.162" dia. x 3 1/2" long, 10d = 0.148" dia. x 3" long, 10dx1 1/2" = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

CODES: See page 12 for Code Reference Key Chart.

*Installed Cost Index not available on these models.

TOP FLANGE HANGERS – SOLID SAWN LUMBER (DF/SP)

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction, refer to Simpson Strong-Tie® Connector Selector™ software or conservatively divide the uplift load by 1.6.

2. 16d sinkers may be used where 10d commons are called out with no load reduction.

3. **NAILS:** 16d = 0.162" dia. x 3 1/2" long, 10d = 0.148" dia. x 3" long, 10dx1 1/2" = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

See footnotes on page 90.

LRUZ Rafter Hanger

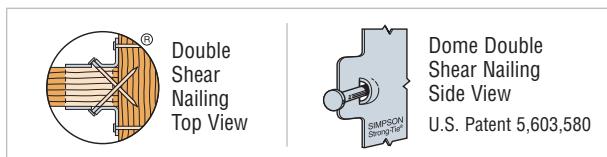

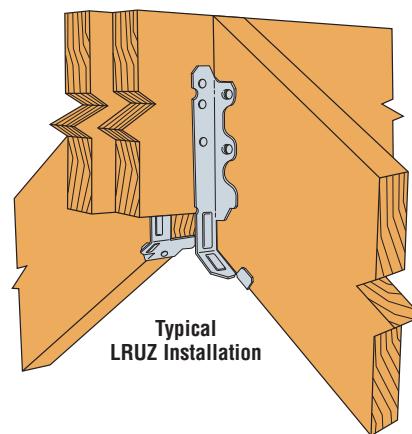

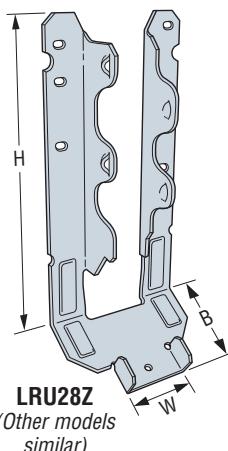

The LRUZ offers an economic alternative for those applications requiring a sloped hanger for rafter-to-ridge connections. Used with solid-sawn rafters, the LRUZ's unique design enables the hanger to be installed either before or after the rafter is in place. The field-adjustable seat helps improve job efficiency by eliminating mismatched angles in the field and lead times associated with special orders. The LRUZ offers comparable or better load capacity to other rafter hangers at a reduced cost while using fewer fasteners.

FEATURES:

- The open design and ability to field-adjust the slope makes the LRUZ ideal for both retrofit or new applications
- Accommodates roof pitches from 0:12 to 14:12
- **Slopes up or down to 45° (12:12). For slopes greater than 45° up to 49° (14:12), allowable loads are 0.85 of table loads**
- For added versatility, the fasteners on the face of the hanger are placed high enabling the bottom of the rafter to hang below the ridge beam (see "Max. C₁" dimension)
- Can be installed using nails or Simpson Strong-Tie® Strong-Drive® SD Connector screws

MATERIAL: 18 gauge**FINISH:** ZMAX® coating (G-185)**INSTALLATION:**

- Use all specified fasteners. See General Notes.
- Joist fasteners must be installed at an angle through the rafter or joist into the header to achieve the table loads.
- See alternate installation on page 93 for retrofit applications.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

1. Allowable loads are based on a minimum 3" carrying member. For single 2x carrying members, use 10dx1 $\frac{1}{2}$ " nails into the face and 10d commons into the joist, and reduce the allowable load to 0.81 of the tabulated value for 10d nails. Alternatively, use #10x1 $\frac{1}{2}$ " Strong-Drive® SD Connector screws into the face and #10x2 $\frac{1}{2}$ " Strong-Drive SD Connector screws into the joist as shown in the table.

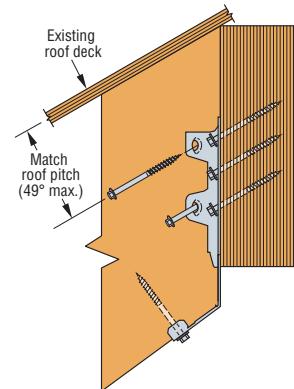

2. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.

3. **NAILS:** 16d = 0.162" dia. x 3 $\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, 10dx1 $\frac{1}{2}$ = 0.148" dia. x 1 $\frac{1}{2}$ " long. See pages 22-23 for other nail sizes and information.

4. **SCREWS:** SD #10x2 $\frac{1}{2}$ (model SD10212) = 0.161" dia. x 2 $\frac{1}{2}$ " long, SD #10x1 $\frac{1}{2}$ (model SD10112) = 0.161" dia. x 1 $\frac{1}{2}$ " long.

LRUZ Rafter Hanger**Alternate Installation for Retrofit Applications**

When an existing roof deck prevents the horizontal installation of fasteners, #10x2½" Strong-Drive® SD Connector screws may be installed sloped upward to match the roof pitch (49° max.). Use table values for an installation with 10d nails when Strong-Drive SD Connector screws are sloped. Nails may not be installed sloped upward.

Alternate Installation for Retrofit Applications

1. Allowable loads are based on a minimum 3" thick carrying member.

2. Uplift loads have been increased for wind or earthquake loading with no further increase allowed.

Reduce where other loads govern.

3. Fasteners may be angled upward a maximum of 49°.

4. SCREWS: SD #10x2½ (model SD10212) = 0.161" dia. x 2½" long.

1. Minimum ridge beam depths shown assume rafter and ridge beam are flush at the top.

2. Minimum ridge beam depths have been determined to ensure the Max C₁ dimension for the LRU is not exceeded.

Deeper ridge beams may be required to support the rafter loads as determined by the Designer.

3. The International Residential Code requires the ridge to be not less in depth than the cut end of the rafter unless the ridge is designed as a beam.

Installation on Minimum Depth Beam
(See footnote 3 at left)

PF/PFB/PFDB Post Frame Hangers

The PF series hangers have been redesigned to accommodate collated nails (0.148x1½) as well as the 10d common nail (0.148x3). The PFB and PFDB have dome-shaped joist nail holes that guide nails into the proper installation angle. The redesign also features a folded seat that raises the 2x joist very slightly above the seat radius to enable a tighter connection to the back of the hanger.

FEATURES:

- Installation prongs make setting the hanger quick and easy
- Sizes are available for 2x8 joists

MATERIAL: 20 gauge

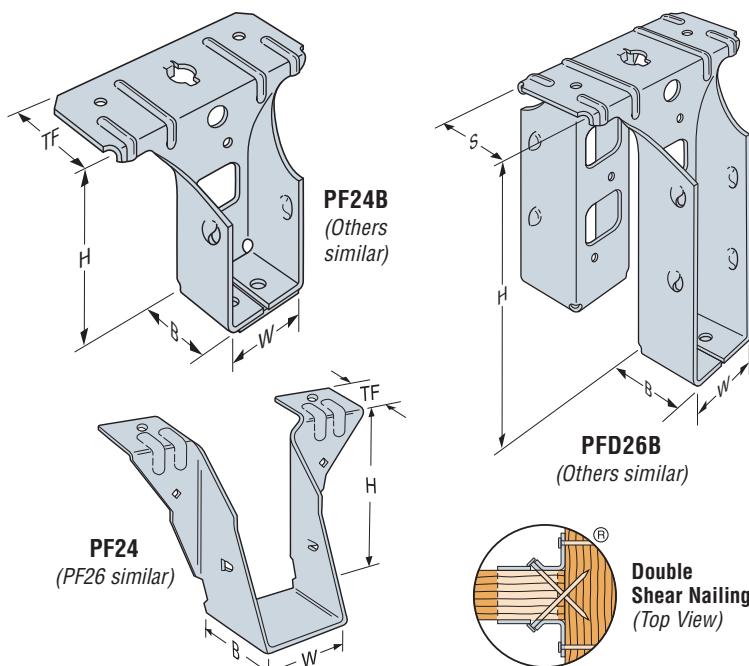

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners.

See General Notes.

- 10d common purlin nails must be driven at an angle through the purlin into the header. Combine with top nails to achieve table loads.
- 10dx1½ purlin nails must be driven at an angle into the purlin but do not penetrate into the header. Combine with back face fasteners and top nails to achieve table loads.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The LSU and LSSU series of hangers may be sloped and skewed in the field, offering a versatile solution for attaching joists and rafters. These hangers may be sloped up or down and skewed left or right, up to 45°.

MATERIAL: See table

FINISH: Galvanized. Some products available in ZMAX® coating;
see Corrosion Information, pages 13-15.

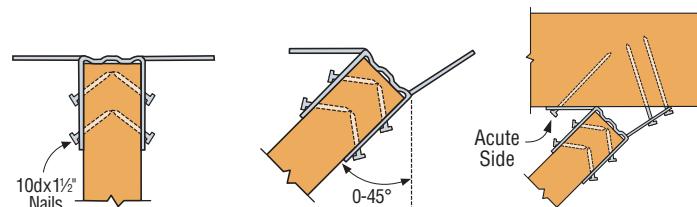

INSTALLATION:

- Use all specified fasteners. See General Notes.
- Attach the sloped joist at both ends so that the horizontal force developed by the slope is fully supported by the supporting members.
- To see an installation video on this product, visit www.strongtie.com.

CODES: See page 12 for Code Reference Key Chart.

LSU and LSSU INSTALLATION SEQUENCE

(For Skewed or Sloped/Skewed Applications)

STEP 1

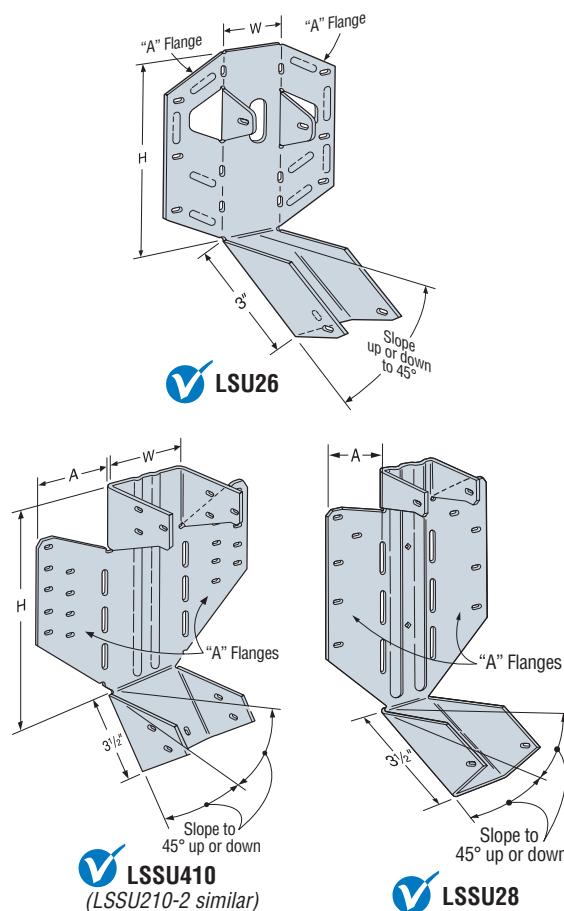

Nail hanger to slope-cut carried member, installing seat nail first. No bevel necessary for skewed installation. Install joist nails at 45° angle.

STEP 2

Skew flange from 0-45°. Bend other flange back along centerline of slots until it meets the header. Bend one time only.

STEP 3

Attach hanger to the carrying member, acute angle side first (see footnote 4). Install nails at an angle.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Roof loads are 125% of floor loads unless limited by other criteria.
2. Uplift loads include an increase for wind or earthquake loading with no further increase allowed; reduce when other loads govern.
3. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2007. Simpson Strong-Tie® Connector Selector™ Software includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
4. For skewed LSSU hangers, the inner most face fasteners on the acute angle side are not installed.
5. Do not substitute 10dx1½" nails for face nails on slope and skew combinations or skewed only LSU and LSSU.
6. **NAILS:** 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, 10dx1½" = 0.148" dia. x 1½" long.
See pages 22-23 for other nail sizes and information.

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The SU and HSU series of hangers are skewed 45° left or right.
Angled nail slots direct nails for proper installation.

MATERIAL: SUR and SUL—16 gauge; HSUR and HSUL—14 gauge

FINISH: Galvanized. Some products available in ZMAX® coating;
see Corrosion Information, pages 13–15.

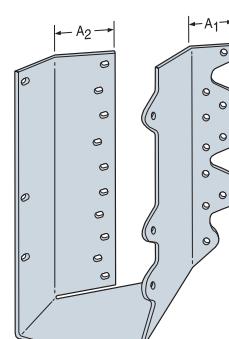

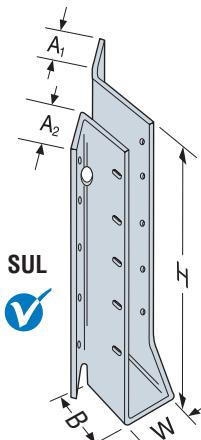

INSTALLATION: • Use all specified fasteners. See General Notes.

- These hangers will normally accommodate a 40° to 50° skew.
- Illustration shows left and right skews SUR/L (SUR=skewed right; SUL=skewed left).
- The joist end may be square cut or bevel cut.
- For installations to concrete/masonry walls, see page 175.

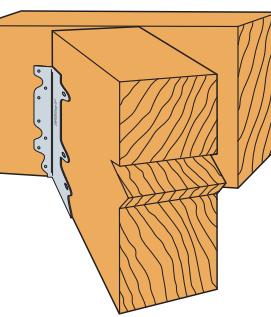

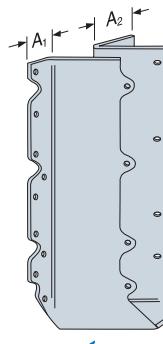

OPTIONS:

- Available with the A₂ flange turned in on the 2-2x and 4x models only (see illustration).
- To order, add "C" (for concealed) to the product name.
- For example, specify HSURC46, HSULC46, SURC46, or SULC46.

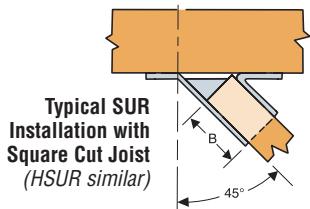

CODES: See page 12 for Code Reference Key Chart.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. Roof loads are 125% of floor loads unless limited by other criteria.

3. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2007.

Simpson Strong-Tie® Connector Selector™ Software includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.

4. **NAILS:** 16d = 0.162" dia. x 3 1/8" long, 16dx2 1/2" = 0.162" dia. x 2 1/2" long, 10dx1 1/2" = 0.148" dia. x 1 1/2" long.
See pages 22–23 for other nail sizes and information.

Solid Sawn Joist Hangers

VPA Variable Pitch Connectors

SIMPSON**Strong-Tie**

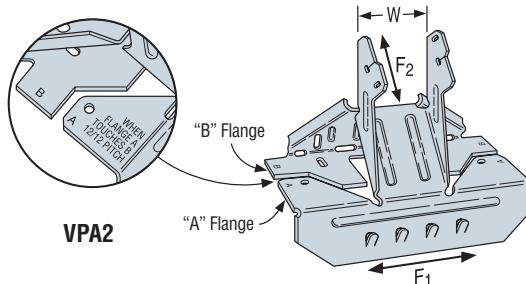

The VPA may be sloped in the field, offering a versatile solution for attaching rafters to the top plate. It will adjust to accommodate slopes between 3:12 and 12:12, making it a complement to the versatile LSSU. This connector eliminates the need for notched rafters, beveled top plates and toe nailing.

MATERIAL: 18 gauge**FINISH:** Galvanized**INSTALLATION:**

- Use all specified fasteners. See General Notes.

CODES: See page 12 for Code Reference Key Chart.

A and B flanges touch at 45°

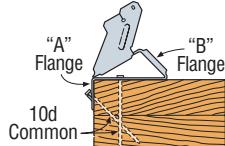

Joist Width	Model No.	W	Fasteners		DF/SP Allowable Loads				SPF/HF Allowable Loads				Code Ref.

3½	VPA4	3½"	11-10d	2-10dx1½"	295	1230	375	250	250	1020	325	250		

1. Uplift loads include an increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

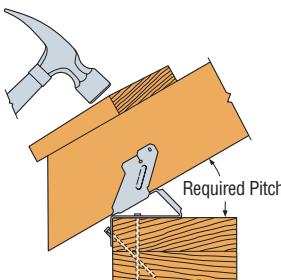

2. Loads may not be increased for short-term loading.

3. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1½" = 0.148" dia. x 1½" long.
See pages 22-23 for other nail sizes and information.

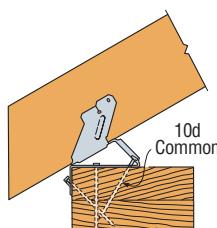

VPA INSTALLATION SEQUENCE

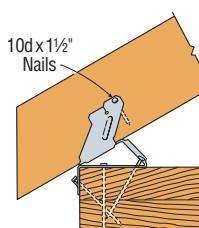

STEP 1
Install top nails and face PAN nails in "A" flange to outside wall top plate.

STEP 2
Seat rafter with a hammer, adjusting "B" flange to the required pitch.

STEP 3
Install "B" flange nails in the obround nail holes, locking the pitch.

STEP 4
Install 10dx1½" nail into tab nail hole. Hammer nail in at a slight angle to prevent splitting.

HCP Hip Corner Plates

The HCP connects a rafter or joist to double top plates at a 45° angle.

MATERIAL: 18 gauge**FINISH:** HCP2—galvanized or ZMAX® coating; HCP4Z—ZMAX coating**INSTALLATION:** • Use all specified fasteners. See General Notes.

- Attach HCP to double top plates; birdsmouth not required for table **uplift loads but may be required for download**.
- Install rafter and complete nailing. Rafter may be sloped to 45°.

CODES: See page 12 for Code Reference Key Chart.

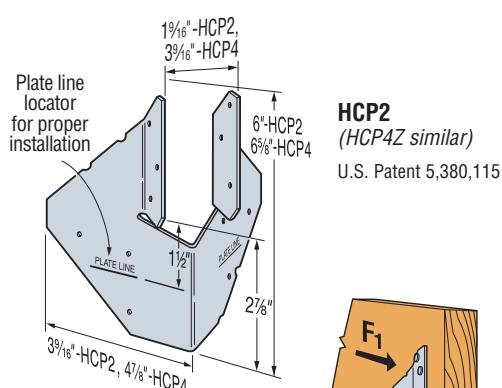

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Member Size	Model No.	Fasteners		DF/SP Allowable Loads		SPF/HF Allowable Loads		Code Ref.	
		To Rafters	To Plates	(160)		(160)			
				Uplift	F1	Uplift	F1		
2x	HCP2	6-10dx1½	6-10dx1½	645	300	555	260	I8, F7, L15	
4x	HCP4Z	8-10d	8-10d	1000	265	860	230		

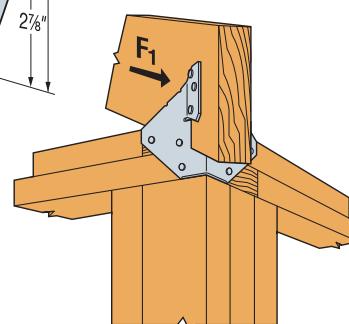

1. Loads include an increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. The HCP can be installed on the inside and the outside of the wall with a flat bottom chord truss and achieve twice the load capacity.

3. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1½" = 0.148" dia. x 1½" long.
See pages 22-23 for other nail sizes and information.

HCP2
(HCP4Z similar)
U.S. Patent 5,380,115

Typical HCP Installation

HRC/HHRC Hip Ridge Connectors

The HRC series are field slopeable connectors that attach hip roof beams to the end of a ridge beam. The HRC may be sloped downward a maximum of 45°.

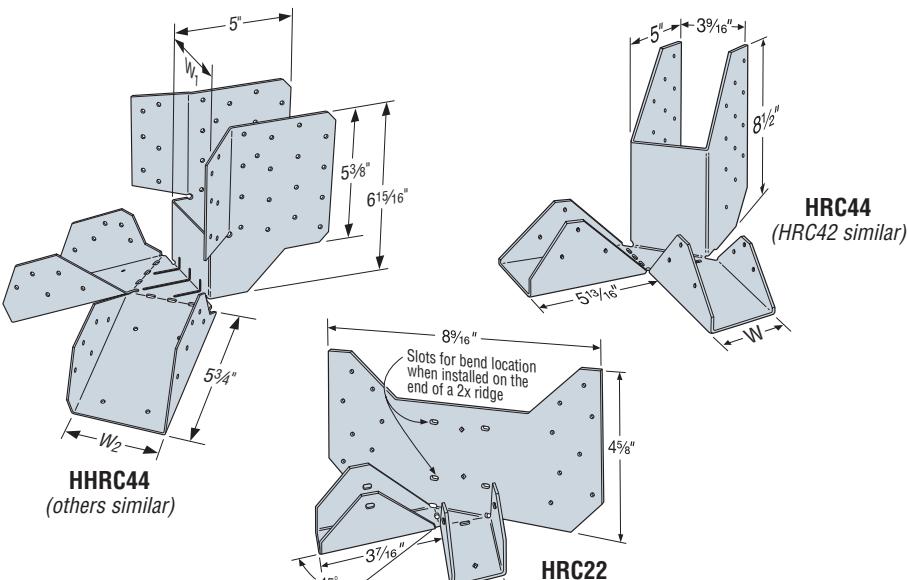

MATERIAL: HRC22, HRC42—16 gauge; HRC44—14 gauge; HHRC—12 gauge

FINISH: Galvanized

INSTALLATION:

- Use all specified fasteners. See General Notes.
- On end of ridge—use optional diamond holes on HRC22 and HRC42 to secure the HRC. Bend face flanges on HRC22 back flush with ridge, and complete nailing.
- HRC22 on face of ridge—adjust to correct height and install nails.
- Double bevel-cut hip members to achieve full bearing capacity **with HRC**.

CODES: See page 12 for Code Reference Key Chart.

**HRC Allowable Loads**

Model No.	Member Size		Fasteners		DF/SP Allowable Loads				SPF/HF Allowable Loads				Code Ref.
	W	Ridge	Carrying Member	Each Hip	Uplift (160)	Floor (100)	Snow (115)	Roof (125)	Uplift (160)	Floor (100)	Snow (115)	Roof (125)	
HRC22	1 1/16	2x or 1 3/4" wide	16-10dx1 1/2	2-10dx1 1/2	290	720	830	900	250	625	720	780	I8, F15
HRC42	1 1/16	4x	16-16d	2-10dx1 1/2	290	1050	1050	1050	250	905	905	905

1. Allowable loads shown are for each hip. Total load carried at the ridge is 2x the load listed.

2. Uplift loads include an increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

3. **FASTENERS:** SD10212 = 0.162" dia. X 2 1/2" long Strong-Drive® SD Connector screws (*provided*).

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The THA series' extra long straps allow full code nailing and can be field-formed to give top flange hanger convenience.

Designed for 4x2 floor trusses and 4x beams, the THAR/L422 has a standard skew of 45°. Straps must be bent for top flange hanger installation. PAN nailing helps eliminate splitting of 4x2 truss bottom chords.

MATERIAL: See table **FINISH:** Galvanized. Some products available in ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

The following installation methods may be used:

- **Top Flange Installation**—The straps must be field formed over the header – see table for minimum top flange requirements. Install top and face nails according to the table. Top nails shall not be within $\frac{1}{4}$ " from the edge of the top flange members.

For the THA29, nails used for joist attachment must be driven at an angle so that they penetrate through the corner of the joist and into the header. For all other top flange installations, straighten the double shear nailing tabs and install the nails straight into the joist.

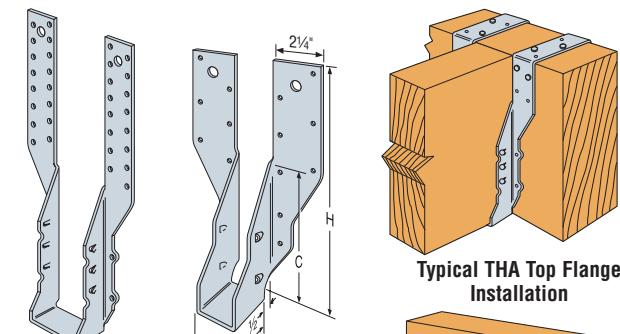

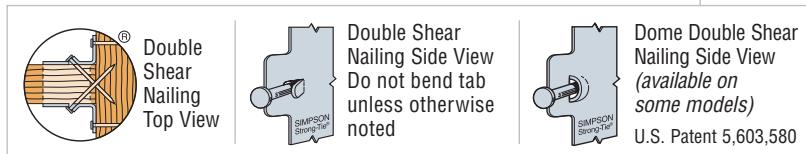

- **Face Mount Installation**—Install all face nails according to the table. Not all nail holes will be filled on all models. On models where there are more nail holes than required, the lowest 4 face holes must be filled. Nails used for the joist attachment must be driven at an angle so that they penetrate through the corner of the joist into the header.

- **Alternate Installation**—The THA 4x hangers may be installed in a top flange configuration using the tabulated fasteners for face mount installation and achieve the face mount installation loads. Install the tabulated face nails into the face and top of the carrying member. Nails used for the joist attachment must be driven at an angle so that they penetrate through the corner of the joist into the header.

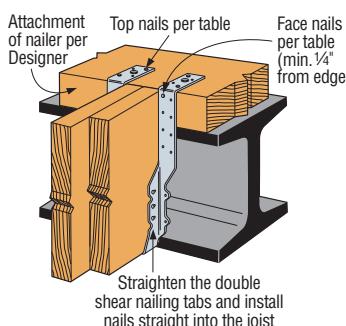

- **Uplift**—Lowest face nails must be filled to achieve uplift loads.

OPTIONS: • THA hangers available with the header flanges turned in for $3\frac{5}{8}$ " (except THA413) and larger, with no load reduction – order THAC hanger.

CODES: See page 12 for Code Reference Key Chart.

1. 16d sinkers may be used to replace 16d commons at 0.85 of table load.
2. Uplift has been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
3. Roof loads are 125% of floor loads unless limited by other criteria.
4. THAR/L422 with 4-10d top nails and 2-10d face nails: When the hanger height is between 9" to 12", the allowable download is 1440 lbs. for DFL and 1210 lbs. for SPF. No further increase allowed.

5. For top flange installation on a nailer (see detail above), install joist nails straight by bending the double shear tabs.
6. For single 2x and 3x nailers, the following THA hangers can be installed using 10dx1 1/2" top nails and 2-16d face nails with reduced allowable loads as noted: THA418/THA422: 1415 lbs. for DFL, 1215 lbs. for SPF; THA426: 2245 lbs. for DFL, 1930 lbs. for SPF.
7. Min. Top Flange refers to the minimum length of strap that must be field-formed over the header.
8. **NAILS:** 16d = 0.162" dia. x 3 1/2" long, 16dx2 1/2" = 0.162" dia. x 2 1/2" long, 10d = 0.148" dia. x 3" long, 10dx1 1/2" = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

HFN/F Panelized Construction Hangers

The HF24N, HF26N, HF34N and HF36N hangers are designed for panels or components using jigs or similar devices for precision fabrication. Grip-groove feature provides positive lock into the 2x or 3x member without nailing. F series panel hangers are engineered components for panelized construction only.

MATERIAL: 18 gauge

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, pages 13-15.

STANDARD INSTALLATION:

- Use all specified fasteners in pre-manufactured holes. See General Notes.
- On the F-series hanger, the diamond hole nail is non-structural and does not contribute to the load.
- For additional information on retrofit options see flier F-RUZNRUZ.

PANELIZED INSTALLATION:

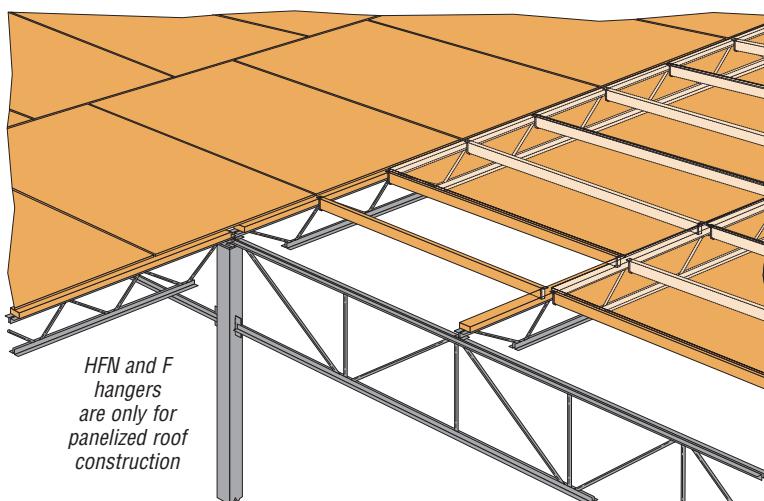

- Installing two nails through sheathing in middle of hanger achieves full load. See illustrations for fastener location requirements. See T-HFHANGER for alternate nailing and allowable load adjustments.

CODES: See page 12 for Code Reference Key Chart.

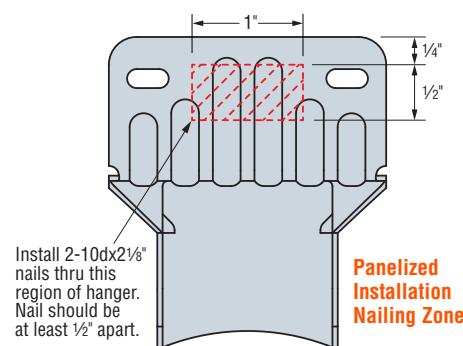

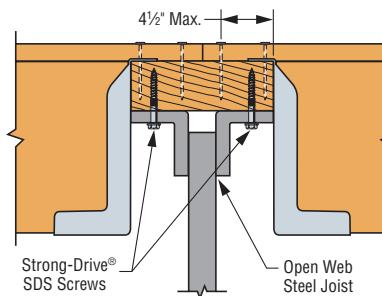

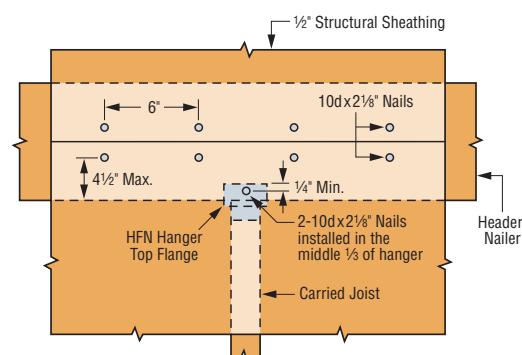

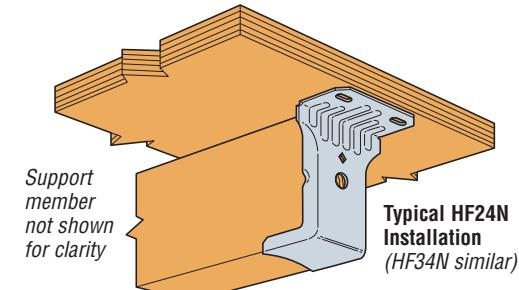

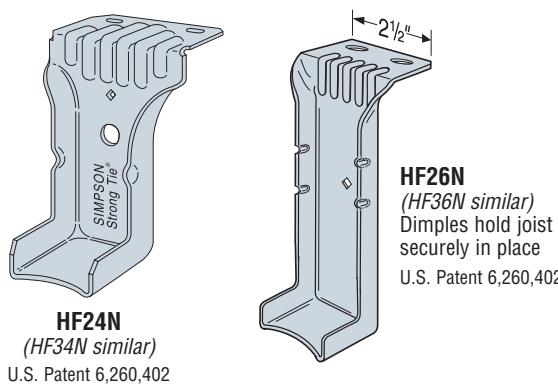

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. 10d common nails can be used for specified 10dx2 1/8 nails.
2. See technical bulletin T-HFHANGER for additional applications and loads.
3. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx2 1/8 = 0.148" dia. x 2 1/8" long.
See pages 22-23 for other nail sizes and information.

Typical Hybrid Panelized Roof System

FACE MOUNT HANGERS HU/HUC/HUCQ/HGUS

Glulam Beam & Double Shear Joist Hangers

SIMPSON**Strong-Tie**

See Hanger Options on pages 233-243 for hanger modifications, which may result in reduced loads.

HU/HUC—Most models have triangle and round holes. To achieve maximum loads, fill both round and triangle holes with common nails.

HGUS—Face mount hanger used for high load applications. All hangers in this series have double shear nailing. This innovation distributes the load through two points on each joist nail for greater strength. It also allows the use of fewer nails, faster installation, and the use of common nails for all connections.

HUCQ—Heavy duty joist hangers that incorporate Simpson Strong-Tie® Strong Drive® SDS Heavy-Duty Connector screws.

MATERIAL: See tables **FINISH:** Galvanized. Some products available in ZMAX® or HDG coating; see Corrosion Information, pages 13-15.

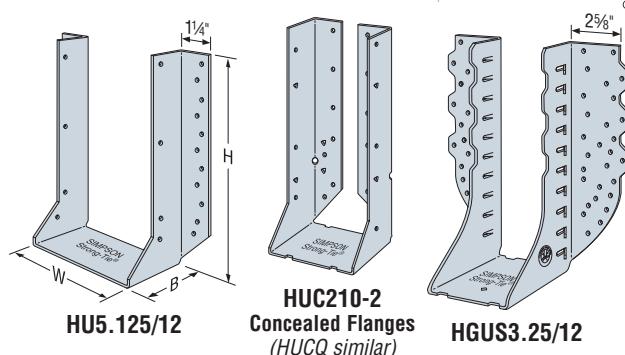

INSTALLATION: • Use all specified fasteners. See General Notes.

- **HU/HUC**—can be installed filling round holes only, or filling round and triangle holes for maximum values.
- **HGUS**—Nails must be driven at an angle through the joist or truss into the header to achieve the table loads.
- **HUCQ**—Install $1/4" \times 2\frac{1}{2}"$ Strong-Drive SDS Heavy-Duty Connector screws (*provided*) in all round holes. Lag screws will not achieve the same load.
- With 3x carrying members, use $16dx2\frac{1}{2}"$ ($0.162"$ dia. x $2\frac{1}{2}"$ long) nails into the header and 16d commons into the joist with no load reduction. With 2x carrying members, use $10dx1\frac{1}{2}"$ ($0.148"$ dia. x $1\frac{1}{2}"$ long) nails into the header and 10d commons into the joist, and reduce the load to 0.64 of the table value.
- For installations to masonry or concrete, see page 175.

OPTIONS: • HU hangers available with the header flanges turned in for $2\frac{1}{16}"$ and larger widths, with no load reduction—order HUC hanger.

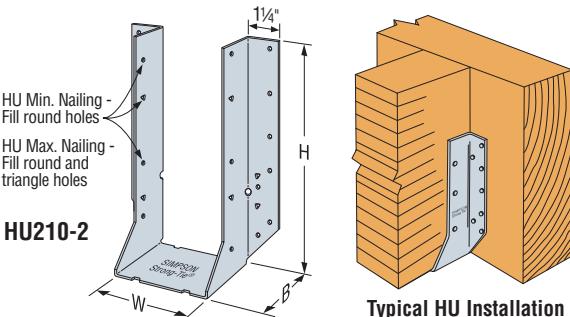

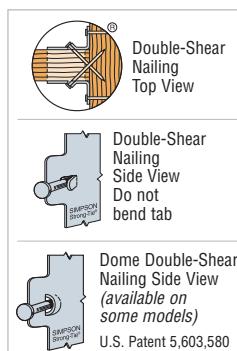

- See Hanger Options on pages 233-243, for sloped and/or skewed HU models, and HUC (*concealed flange*) models.
- Concealed flanges are not available for HGUS.
- **HGUS** may be skewed only up to a maximum of 45°. See Hanger Options page 237 for load reductions.
- Other sizes available; contact Simpson Strong-Tie.
- See also HUS series.
- HUCQ hangers cannot be modified.

CODES: See page 12 for Code Reference Key Chart.

HU5.125/12
Concealed Flanges
(HUCQ similar)

HGUS3.25/12

HU210-2
Projection seat on most models
for maximum bearing and
section economy.

Model configurations may differ from those shown. Some HU models do not have triangle holes. Contact Simpson Strong-Tie for details.

These products are available with additional corrosion protection.
Additional products on this page may also be available with this option,
check with Simpson Strong-Tie for details.

LGU/MGU/HGU/HHGU High-Capacity Girder Hangers

The GU hangers are high-capacity girder hangers designed for situations where the header and joist are flush at the top. These products can be used for retrofit on the framing members after they are temporarily placed in position. Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws make installation fast and easy, with no pre-drilling required.

MATERIAL: See table

FINISH: Galvanized, HHGU—Simpson Strong-Tie® gray paint. Available in hot-dip galvanized, order as "X" version and specify HDG.

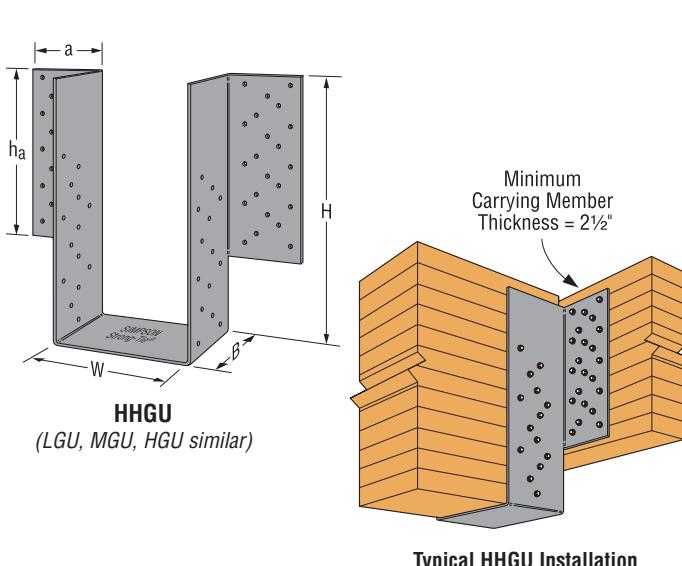

INSTALLATION: • Use all specified fasteners. See General Notes.

- Install with $\frac{1}{4}'' \times 2\frac{1}{2}''$ Strong-Drive SDS Heavy-Duty Connector screws, which are provided with the GUs. (Note: lag screws will not achieve the same loads.)
- All multiple members must be fastened together to act as a single unit.
- Multiple member headers may require additional fasteners at the hanger locations. The quantity and location of the additional fasteners must be determined by the Designer.
- For installation to concrete or masonry walls, see LGUM and HGUM hangers page 176.

OPTIONS:

- Other seat widths available. Order as "X" version, specify width.
- See Hanger Options, pages 233-243, for one flange concealed option. MGU with W 4" or less and HGU with W $4\frac{1}{8}$ " or less cannot be concealed.
- LGU, MGU and HGU hangers may be skewed up to 45°. See page 243.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed.

2. Specify H dimension. Maximum H = 30".

3. Header height must be at least as tall as the flange height (ha).

4. Where noted, allowable loads may be increased for duration of load up to 20455 lbs. for DF/SP and 14725 lbs. for SPF/HF.

TOP FLANGE HANGERS HHB/GB/HGB Beam & Purlin Hangers

See table on page 105. See Hanger Options on pages 233-243 for hanger modifications, which may result in reduced loads.

This series of beam and purlin hangers may be used for wood to wood or wood to steel applications. Precision forming provides dimensional accuracy and helps ensure proper bearing area and connection.

MATERIAL: See table on page 105

FINISH: HHB, GB, HGB, all saddle hangers and all welded sloped and special hangers—

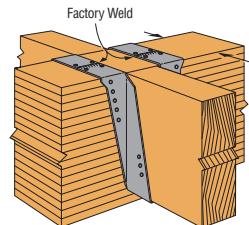

Simpson Strong-Tie® gray paint. May be ordered hot-dip galvanized; specify HDG.

INSTALLATION: • Use specified fasteners. See General Notes.

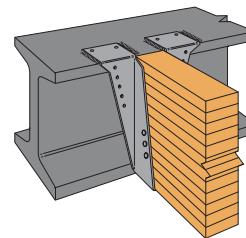

- HHB, GB and HGB may be used for weld-on applications. The minimum required weld to the top flanges is $\frac{3}{16}$ " x 2" fillet weld to each side of each top flange tab. Distribute the weld equally on both top flanges. Welding cancels the top and face nailing requirements. Consult the code for special considerations when welding galvanized steel. The area should be well-ventilated. See page 17 for weld information. Weld on applications produce the maximum allowable load listed. Uplift loads do not apply to welded applications.
- Ledgers must be evaluated for each application separately. Check TF dimension, nail length and nail location on ledger.

OPTIONS: • HHB—other widths are available; specify W dimension (*the minimum W dimension is 2½"*).

- Saddle hangers are made to order; add "D" to model (e.g. HHBD3); specify S (for saddle) dimension. They may be used for most conditions except at end wall locations, and are preferred for nailer applications.
- The coating on special B hangers will depend on the manufacturing process used. Check with your Simpson Strong-Tie representative for details. Hot-dip galvanized available: specify HDG.
- B dimensions may be increased on some models.
- See Hanger Options, pages 233-243.

Typical HHB, GB and HGB Saddle Installation

HHB, GB and HGB are acceptable for weld-on applications. See Installation Information.

TOP FLANGE HANGERS WM/WMU/WP/WPU/HW/HWU

The WPU, HWU and HW series purlin hangers offer the greatest design flexibility and versatility.

MATERIAL: WP/WPU—7 ga. top flange, 12 ga. stirrup; HW—3 ga. top flange,

11 ga. stirrup; HWU—3 ga. top flange, 10 ga. stirrup

FINISH: Simpson Strong-Tie gray paint; hot-dip galvanized available: specify HDG.

INSTALLATION: • Hangers may be welded to steel headers with $\frac{3}{16}$ " for WPU/WP, and $\frac{1}{4}$ " for HW/HWU, by $\frac{1}{2}$ " fillet welds located at each end of the top flange. Weld-on applications produce maximum allowable load listed. See page 17 for weld information. For uplift loads refer to technical bulletin T-WELDUPLFI.

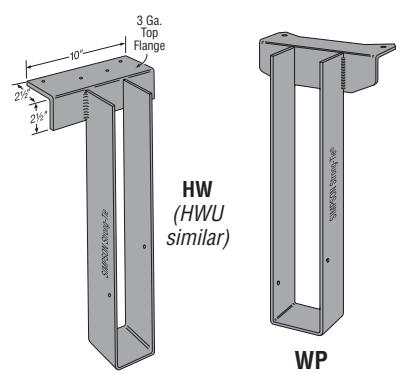

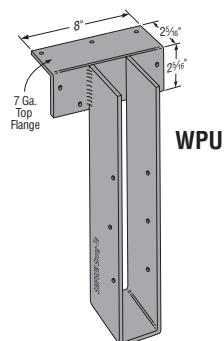

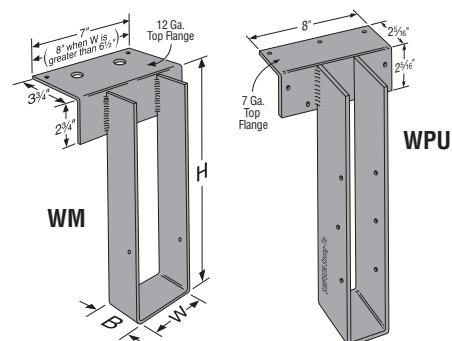

- Hangers can support multi-ply carried members; the individual members must be secured together to work as a single unit before installation into the hanger.
- **WM/WMU MID-WALL INSTALLATION:** Installed between blocks with duplex nails cast into grout with a minimum of one grouted course above and below the top flange and one #5 vertical rebar minimum 24" long in each adjacent cell.
- **WM/WMU TOP-OF-WALL INSTALLATION:** Install on top of wall to a grouted beam with masonry screws.

OPTIONS: See Hanger Options, pages 233-243, for hanger modifications and associated load reductions.

CODES: See page 12 for Code Reference Key Chart.

Model	Nailer	Top Flange Nailing	Allowable Loads

Some model configurations may differ from those shown. Contact Simpson Strong-Tie for details.

NAILER TABLE

The table indicates the maximum allowable loads for WP, WPU, HW or HWU hanger used on wood nailers. Nailers are wood members attached to the top of a steel I-beam, concrete or masonry wall.

1. Uplift value for the HWU hanger is for depth $\leq 18"$. Refer to uplift values in table below for taller depths.
2. Attachment of nailer to supporting member is the responsibility of the Designer. See page 25 for TB screws attachment option.

1. 16d sinkers (0.148" dia x 3⅔" long) may be used where 10d commons are called out with no load reduction.

2. Uplift loads are based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.

3. Minimum $f_m = 1500$ psi. See Installation Notes on page 173.

4. For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.

5. **NAILS:** 16d = 0.162" dia x 3⅔" long; 10d = 0.148" dia x 3" long.

10dx1½ = 0.148" dia x 1½" long. See pages 22-23 for other nail sizes and information.

TOP FLANGE HANGERS GLS/HGLS/GLT/HGLT Beam & Glulam Saddle Hangers

See table on page 105. See Hanger Options on pages 233-243 for hanger modifications, which may result in reduced loads.

GLT and HGLT accommodate typical structural requirements for timber and glulam beams. GLT top flange depth allows installation on minimum 4x ledger ($3\frac{1}{2}$ " net). Not acceptable for nailer applications. Funnel Flanges® allow easy installation of beams.

GLS and HGLS are heavy glulam saddle hangers.

MATERIAL: All welded GL series glulam hangers have a 3 gauge top flange. See page 105 for stirrup gauge.

FINISH: Simpson Strong-Tie® gray paint. Hot-dip galvanized available; specify HDG.

INSTALLATION: • Use all specified fasteners. See General Notes.

GLT/HGLT:

- All GLTs used with sawn timbers have a 12" L dimension.
- Fasteners are included.
- GLT may be attached to steel headers by $\frac{3}{16}$ " x $2\frac{1}{2}$ " fillet welds at each end of the header angle to obtain the tabulated loads. HGLT may be attached to steel headers by $\frac{1}{4}$ " x $2\frac{1}{2}$ " fillet welds at each end of the header angle to obtain the lesser of the tabulated loads or 12,000 lbs. For uplift loads refer to technical bulletin T-WELDULPLFT. See page 17 for weld information.
- Not for use with SCL or LVL headers. See GLTV, HGLTV.

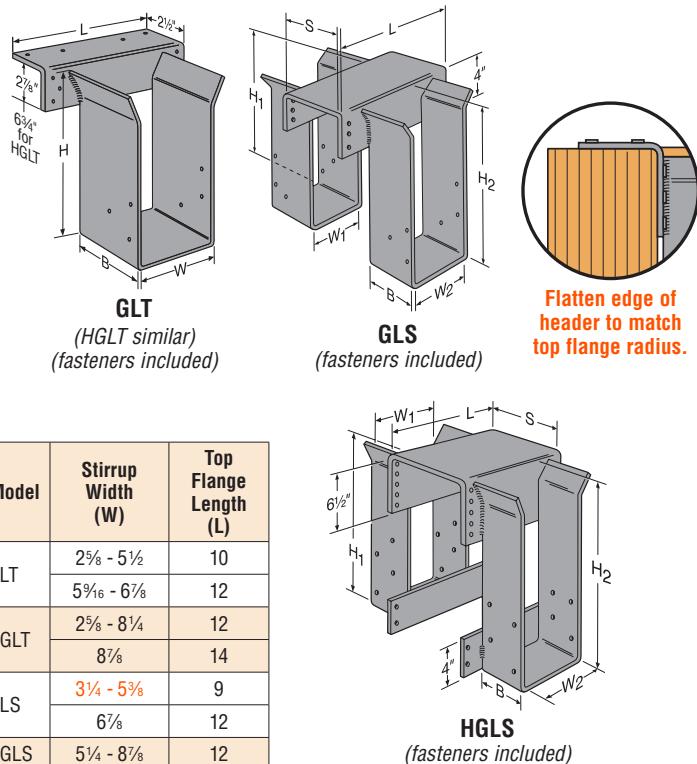

GLS/HGLS:

- Use Simpson Strong-Tie® $\frac{1}{4}$ " x $2\frac{1}{2}$ " SDS Heavy-Duty Connector screws when hangers are used with structural composite lumber.
- N54A nails are included with the hangers.
- Loads listed are per stirrup.

TO ORDER: • GLS/HGLS—Specify H₁, H₂, and S dimensions (see illustration).

- Some engineered wood sizes are also available.

OPTIONS: See Hanger Options pages 233-243.

TOP FLANGE HANGERS LEG/MEG/EG Beam & Glulam Hangers

See Hanger Options on pages 233-243 for hanger modifications, which may result in reduced loads.

Designed to support large members typically found in glulam beam construction.

MATERIAL: See table

FINISH: Simpson Strong-Tie gray paint. Hot-dip galvanized available; specify HDG.

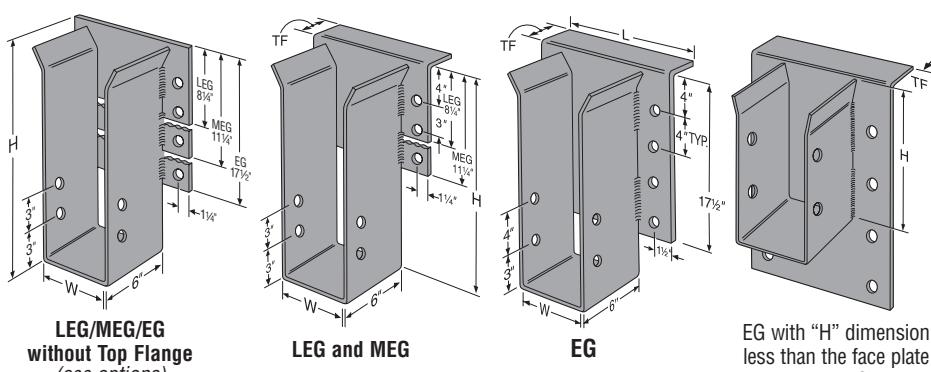

INSTALLATION: • Use all specified fasteners. See General Notes.

- Maintain minimum 4D end distance and edge distance from bolt to end of header and nearest loaded edge per NDS requirements.

OPTIONS: • See Hanger Options, pages 233-243.

- Models available without top flanges; see table loads.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection.

EG with "H" dimension less than the face plate height. The EG's back plate is always $17\frac{1}{2}$ ", regardless of the stirrup height.

EG7	3	13 $\frac{1}{2}$
EG9		15 $\frac{1}{2}$

- Roof loads are 125% of floor loads unless limited by other criteria.
- Allowable loads assume a carrying member width of 5 $\frac{1}{2}$ ".
- Specify H dimension.
- Triangle Theory: Some code jurisdictions allow only half of the top flange bearing area to be considered when performing a top flange hanger calculation as there is non-uniform stress under the top flange (*presumed to be a triangular shaped distribution*). Therefore, loads are published above using the calculated "Triangle Theory". Loads are also published in the "No Triangle Theory" columns which are based on calculations assuming full bearing on the top flange which do not exceed the tested value with a reduction factor of 3.

1. N54A fasteners are supplied with hangers. For GLS and HGLS saddle hangers only, Simpson Strong-Tie® ¼" x 2½" Strong-Drive® SDS Heavy-Duty Connector screws (sold separately) may be substituted using full table loads.
2. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
3. GLT, HGLT, GLS, HGLS uplift loads only apply when "H" is 28" or less.
4. Allowable loads for glulam sizes are based on 650 psi wood bearing.
5. "Min H" is the minimum H dimension that may be specified. For GLT, HGLT, GLS, HGLS hanger heights that exceed the joist height, allowable load is 0.50 of the table load.
6. Allowable loads are shown for each stirrup.
7. GLS, HGLS fasteners listed are for one side only. Fasteners supplied are for both sides of the saddle.
8. SPEC: Specify the header dimensions for the saddle hangers. ("S" dimension is illustrated on page 104.)
9. NAILS: 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, N54A = 0.250" dia. x 2½" long - annular ring. See pages 22-23 for other nail sizes and information.

CODES: See page 12 for Code Reference Key Chart.

GLB/HGLB/GLBT Beam Seats

The GLB Series provides a connection between beam and concrete or CMU pilaster.

FINISH: Simpson Strong-Tie[®] gray paint. Hot-dip galvanized available. Specify HDG.

INSTALLATION:

- Use all specified fasteners. See General Notes.
- Bolt holes in wood shall be a minimum of $\frac{1}{32}$ " to a maximum of $\frac{1}{16}$ " larger than the bolt diameter (*per the 2012 NDS, section 11.1.3.2*).
- Check the rebar spacing requirements on all installations.

OPTIONS:

- Beam seats for sawn timber and other sizes may be ordered by specifying special dimensions; use the letter designations shown on the illustrations.
- Specify if two-bolt GLB model is desired; see illustration.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

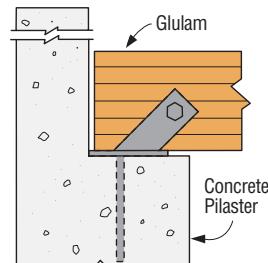

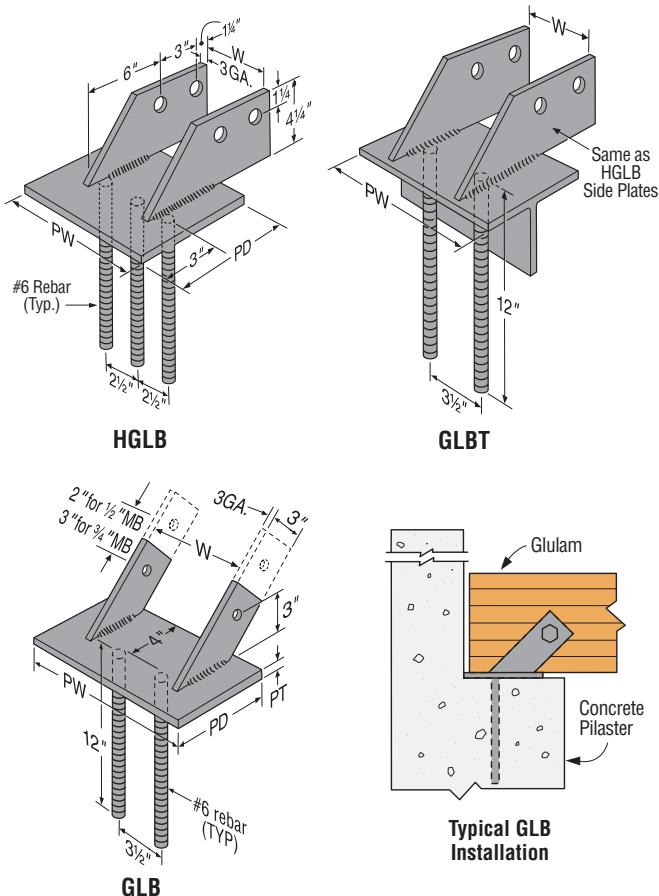

Model No.	Dimensions				Bolts	Allowable Bearing Loads ^{1,2}		Code Ref.
	W	PD	PW	PT		Masonry @ 375 psi	Wood f' _c -perp

GLB7D	6 $\frac{1}{8}$	8	9	$\frac{3}{8}$	1- $\frac{3}{4}$	27000	35100	

1. Allowable bearing stress for masonry is based on an f'm of 1500 psi using the IBC (ACI 530 2.1.9.3) Allowable Stress Design. Wood bearing is based on f'_c-perp of 650 psi.

2. When installed on masonry, use the lesser of the masonry or the wood allowable load values. When installed on concrete, a minimum f'_c = 2500 psi shall be used and use the wood values as the limiting allowable bearing load values.

3. Allowable horizontal loads are bolt values and include increase for wind or earthquake loading. Loads must be reduced if stresses in masonry or concrete are limiting.

4. Beams must fully bear on base plate.
 5. The GLBT5 has a WT4x9 structural tee; the GLBT6 has a WT4x12 structural tee.
 6. Specify "W" dimension when ordering.
 7. Uplift loads do not apply for this connector.

1. Allowable bearing stress for masonry is based on an f'm of 1500 psi using the IBC (ACI 530) Allowable Stress Design. Wood bearing is based on f'_c-perp of 650 psi.

2. When installed on masonry, use the lesser of the masonry or the wood allowable load values.

When installed on concrete, a minimum f'_c = 2500 psi shall be used and use the wood values as the limiting allowable bearing load values.

3. Allowable horizontal loads are bolt values and include increase for wind or earthquake loading.

Loads must be reduced if stresses in masonry or concrete are limiting.

4. Beams must fully bear on base plate.

5. The GLBT5 has a WT4x9 structural tee; the GLBT6 has a WT4x12 structural tee.

6. Specify "W" dimension when ordering.

7. Uplift loads do not apply for this connector.

HCA Hinge Connectors

Hinge connectors are designed to transfer loads between two beams aligned end-to-end through a combination of bearing plates, side plates and bolts. In addition to supporting vertical loads, hinge connectors can also be specified with additional slotted bolt holes to resist horizontal loads as part of a continuous load path.

MATERIAL: Side plates—7 gauge; Top and bottom plates—see PT dimensions in table.

FINISH: Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners. See General Notes.

- Bolt holes shall be a minimum of $\frac{1}{32}$ " and a maximum of $\frac{1}{16}$ " larger than the bolt diameter (per 2012 NDS 11.1.2.2).
- The model size (suffix) column in the Allowable Download Table gives the basic HCA model with two rotation bolts.
- Contact Simpson Strong-Tie for heights greater than 60".
- Position $\frac{3}{8}$ " dia. machine bolts in slots away from bearing seat to allow for wood shrinkage.

OPTIONS: The Horizontal Load Table gives other bolt options.

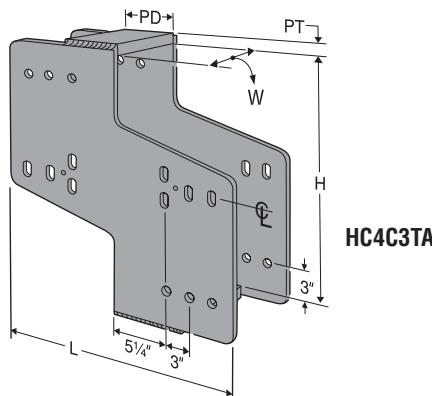

ORDERING: • To order, add the width and bearing plate size designation after the model name. Specify the H dimension. For dapped beams, reduce the H dimension by the PT dimension for each dap.

- Specify Model No., Model Size, and height H.
Ordering Example: HC4C3TA5-6 H = 18".

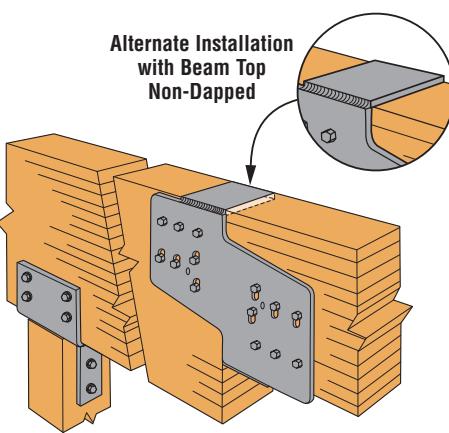

CODES: See page 12 for Code Reference Key Chart.

Model No. (Prefix)	L	H ³ Min	H Max	Rotation Bolts Per Beam	Slotted Tension Bolts	Allowable Horizontal Loads ^{2,3}
						(160)
HCA	19 $\frac{1}{2}$	8	60	2	—	—
HC2CTA	19 $\frac{1}{2}$	14	60	2	2	9920
HCCTA	19 $\frac{1}{2}$	14	60	2	3	14850
HC4CTA	25 $\frac{1}{2}$	14	60	2	4	19720
HC3A	25 $\frac{1}{2}$	8	60	3	—	—
HCC3TA	25 $\frac{1}{2}$	14	60	3	3	14850
HC4C3TA	25 $\frac{1}{2}$	14	60	3	4	19720

1. Loads have been increased for wind or earthquake loading with no further increase allowed.
2. Horizontal loads are for Doug Fir-larch glulams minimum W = 3 $\frac{1}{2}$. For other wood types, adjust the load according to the code.
3. H MIN is the absolute minimum height. Reduce downloads according to footnote 1 in the Allowable Download Table.

Alternate Installation
with Beam Top
Non-Dapped

1. Allowable loads have been increased for roof live loads with no further increase allowed. Reduce where other loads govern.
 2. Loads are based on 560 psi perpendicular to grain bearing stress.
 3. H₁ is the minimum dimension required to achieve full load for the hinge connector. For H dimensions between H₁ and Minimum H, loads may be linearly interpolated.
4. See Horizontal Load Table for models available with three rotation bolts.
 5. Beams must be the same width for both members in the connection.

GENERAL CONNECTOR INSTALLATION

TOP FLANGE HANGERS

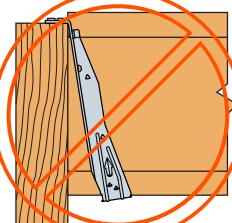

Flush Framing

Top flange configuration and thickness of top flange need to be considered for flush frame conditions.

Hanger Over-Spread

If the hanger is over-spread, it can raise the I-joist above the header and may cause uneven surfaces and squeaky floors.

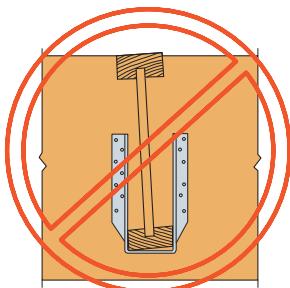

Hanger Not Plumb

A hanger "kicked-out" from the header can cause uneven surfaces and squeaky floors.

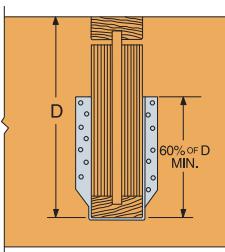

PREVENT ROTATION

Hangers provide some joist rotation resistance; however, additional lateral restraint may be required for deep joists.

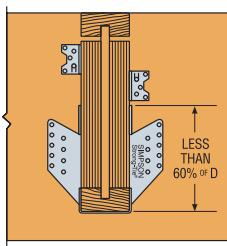

No Rotation Resistance

Lack of web stiffeners combined with short hanger allows unwanted rotation.

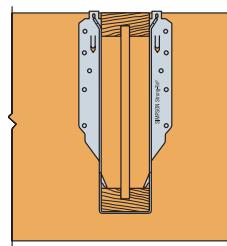

Rotation Prevented by Web Stiffeners

Hanger height should be at least 60% of the joist height.

Rotation Prevented by Web Stiffeners

If hanger height is less than 60% of the joist height, add clips or blocking near the top.

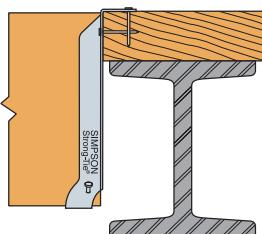

Rotation Prevented by Lateral Flange Support

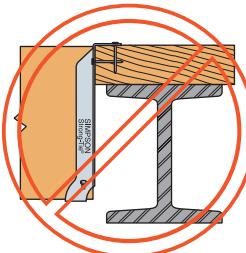

Sides of hanger laterally support the top flange of the I-joist.

No web stiffeners required!

WOOD NAILERS

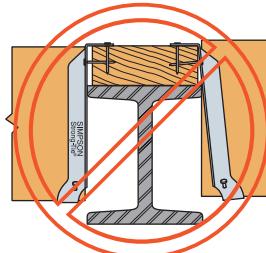

Correct Attachment

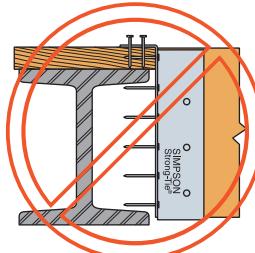

Nailer Too Wide

The loading may cause cross-grain bending. As a general rule, the maximum allowable overhang is $\frac{1}{4}$ ", depending on nailer thickness.

Nailer Too Narrow

Nailer should be full width.

Nailer Too Thin

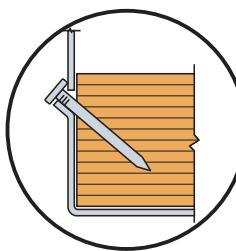

or the wrong hanger for the application.

TOE-NAILING

Toe nailing causes squeaks and improper hanger installations. Do not toe nail I-joists before installing top flange or face mount hangers.

POSITIVE ANGLE NAILING

Correct Nailing
Approx. 45° angle

Nail too long

Nail at wrong angle

GENERAL CONNECTOR INSTALLATION

WOOD I-JOISTS

SLOPED JOISTS

For sloped joists up to 1/4:12 there is no reduction. For slopes greater than 1/4:12 see individual product pages or refer to technical bulletin T-SLOPEJST.

MULTIPLE JOISTS

Multiple joists should be adequately connected together to act as one unit.

FASTENERS

Use the correct nails. Wood may split if the nails are too large. Hanger nails into flanges should not exceed 10d common (0.148 dia.), no longer than 1 1/8". Nails into web stiffeners should not exceed 16d commons (0.162 dia.).

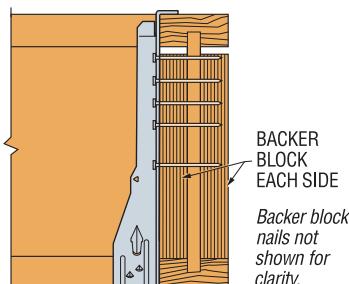

ECCENTRICALLY-LOADED I-JOISTS

Supporting a top flange hanger may require bottom flange restraining straps, blocking or directly-applied ceiling systems to prevent rotation at the hanger location.

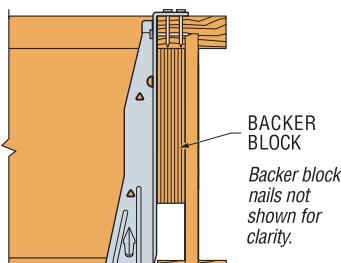

SKewed JOISTS

Joists may be skewed up to 2 1/2 degrees in a non-skewed hanger without any load reduction. Refer to individual hanger descriptions for information allowing any further skew applications.

I-JOIST AS A HEADER INSTALLATIONS

Face Mount Hanger

Top Flange Hanger

When face mount hangers are attached to I-joist headers, backer blocks must be installed to provide a nailing surface for the hanger nails. The backer blocks should be installed on both sides of the web and attached together with a minimum of 10-10d nails. The hanger nails should extend through the web. Contact the I-Joist manufacturer for additional design considerations.

When top flange hangers are attached to I-joist headers, a backer block must be installed to prevent the top flange from rotating under load. The backer blocks should be installed with a minimum of 10-10d nails clinched. Check with the joist manufacturer for additional design considerations.

CSC Ceiling Support Clip / FSS Furring Stabilizer Strap

Provides 1" separation between the furring channel and joist to allow for the use of Thermafiber® insulation and the attachment of the furring channel to all joists. Provides an efficient sound barrier, and a one hour U.L. listed fire rating.

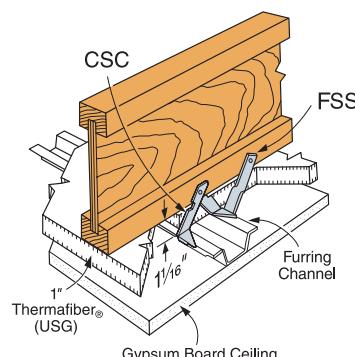

- UL Listed. See Underwriters Laboratory, Inc. Design No. L530 for USG gypsum board and Weyerhaeuser/TJI® joists.
- Check ICC-ES reports for individual I-joist manufacturer approvals.

MATERIAL: 24 gauge (*minimum*)

FINISH: Galvanized

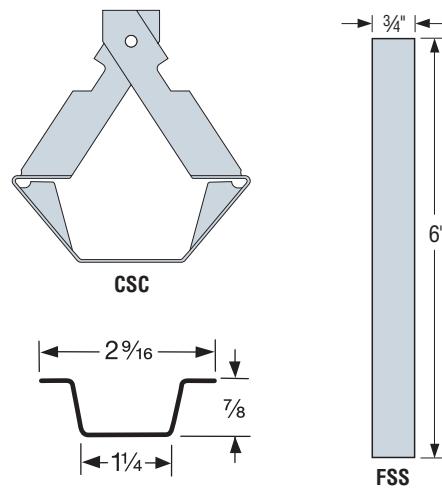

INSTALLATION:

- For CSC use 1-8dx1 1/2 nail.
- For FSS use #8 self-tapping steel screw (*not provided*) into channel, twist 90°, bend upward and fasten to the side of joist bottom flange with screw or nail.

Typical CSC and FSS Installation

Thermafiber® and TJI® are registered trademarks of US Gypsum Company and Weyerhaeuser, respectively.

Furring Channel Detail

(See Installation Notes)

IUS/MIU I-Joist Hangers

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The IUS is a hybrid hanger that incorporates the advantages of the face mount and top mount hanger. Installation is fast with the Strong-Grip™ seat, easy-to-reach face nails and self-jigging locator tabs.

The MIU series hangers are designed for commercial and high load I-joist applications without requiring web stiffeners. The MIU features Positive Angle Nailing (PAN), which minimizes splitting of the flanges while permitting time-saving nailing from a better angle.

Refer to Joist Manufacturer's literature or appropriate Simpson Strong-Tie® Connector Selection Guide for actual joist sizes.

MATERIAL: See table on pages 112-116.

FINISH: Galvanized

UPLIFT LOADS: • Models have optional triangle joist nail holes for additional uplift. Properly attached web stiffeners are required.

- MIU—add four additional 10dx1½" joist nails for a total uplift load of 975 lbs.
- IUS—add web fillers and two 10dx1½" joist nails in the triangle holes for a total uplift of 365 lbs.

INSTALLATION: • Use all specified fasteners. Verify that the header can take the required fasteners specified in the table. See page 108 for more installation information.

• IUS—fasten hanger to header. Position I-joist into hanger and snap into place. No joist nailing required. Some IUS models have triangle and round header nail holes. To achieve Max. download, fill both round and triangle holes.

• IUS—Locator tabs are not structural. They may be bent back to adjust for hanger placement.

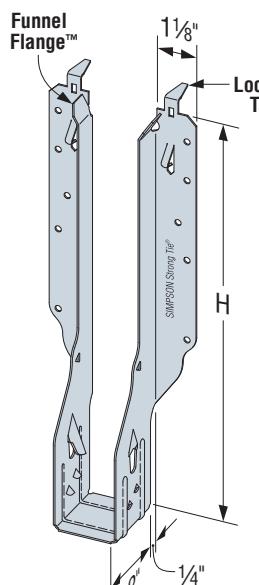

• IUS—for rimboard applications see technical bulletin T-RIMBDHGR.

• IUS—I-joists with web stiffeners or rectangular sections can be used with the installation of 2-10dx1½" nails into the optional triangle joist nails.

• **IUS web stiffeners are not required with I-joists when the top flange is laterally supported by the sides of the hanger unless the manufacturer's no-web-stiffener reaction is exceeded.**

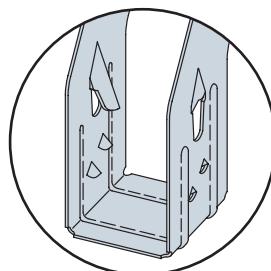

OPTIONS:

These hangers cannot be modified. However, these models will normally accommodate a skew of up to 5°. For sloped joists up to ¼:12 there is no reduction, between ¼:12 and up to ½:12, tests show a 10% reduction in ultimate hanger strength. Local crushing of the bottom flange or excessive deflection may be limiting; check with joist manufacturer for specific limitations on bearing of this type.

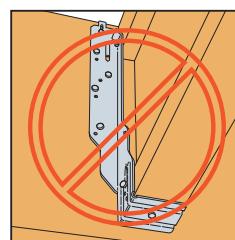

(Some IUS models
have triangle holes
in header flanges
for Min/Max nailing)

U.S. Patent 6,523,321

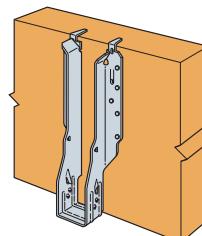

The Strong-Grip™ seat
secures I-joists in position
without joist nails

AVOID A MISINSTALLATION

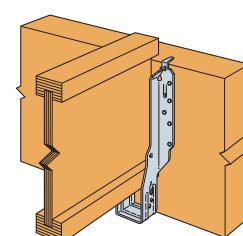

Do not make your own holes.
Do not nail the bottom flange.

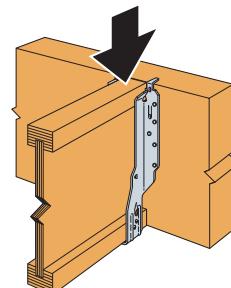

IUS INSTALLATION SEQUENCE

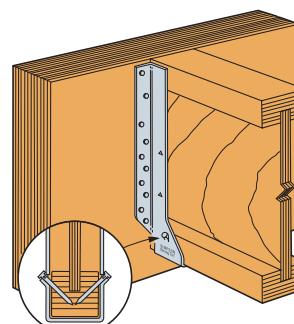

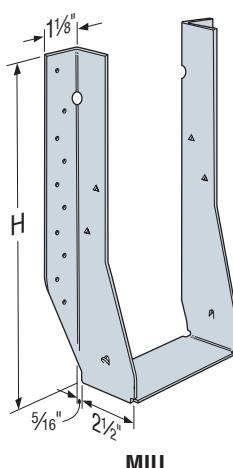

STEP 1
Attach the IUS to
the header

STEP 2
Slide the I-joist downward
into the IUS until it rests
above the large teardrop.

STEP 3
Firmly push or snap
I-joist fully into the
seat of the IUS.

MIU with correct
PAN installation

FACE MOUNT HANGERS U/HU/HUC/HUCQ I-Joist & Structural Composite Lumber Hangers

See Hanger tables on pages 112-116. See Hanger Options on pages 233-243 for hanger modifications, which may result in reduced loads.

U—The standard U hanger provides flexibility of joist to header installation. Versatile fastener selection with tested allowable loads.

HU/HUC—Most models have triangle and round holes. To achieve maximum loads, fill both round and triangle holes with common nails. These heavy-duty connectors are designed for schools and other structures requiring additional strength, longevity and safety factors.

HUCQ—Features concealed flanges so it can be installed close to the end of the supporting beam or on a post. They install with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws (*supplied with the hanger*) for high capacity and ease of installation.

MATERIAL: See tables on pages 112-116. **FINISH:** Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

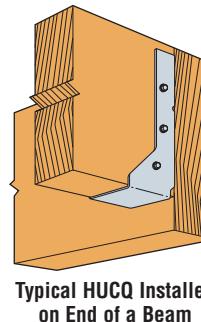

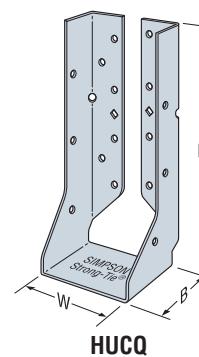

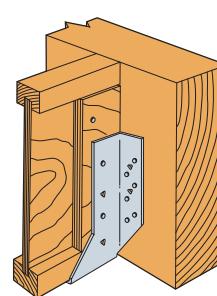

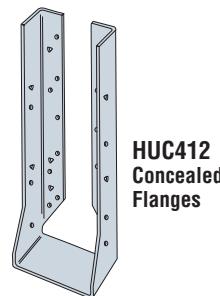

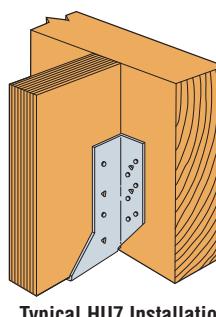

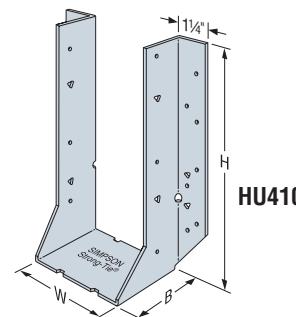

- **HU/HUC**—can be installed filling round holes only, or filling round and triangle holes for maximum values.
- **HUCQ**—When using structural composite lumber columns, the capacities shown in the tables are for fasteners applied to the wide face of the column.
- Web stiffeners are required for all I-joists used with these hangers.
- For installation to masonry or concrete, see page 175.
- HU/HUC hangers can be welded to a steel member. Allowable loads are the lesser of the values in the Hanger tables on pages 112-116 or the weld capacity – refer to technical bulletin T-HUHUC-W.

OPTIONS: • HU is available with one flange concealed when the W dimension is less than $2\frac{3}{16}$ " at 100% of the table load. Order HUC hanger.

Sloped, Skewed and Sloped/Skewed:

- For low-cost, code-listed 45° skews, see SUR/SUL and HSUR/HSUL. See also LSU/LSSU connectors.
- U/HU may be skewed to a maximum of 45° and sloped to a maximum of 45°. Hangers 5 1/2" or less in width may be skewed to 67 1/2°. Hangers skewed 51°- 67 1/2° require a square cut.
- For all options, uplift loads are 0.75 of table loads.
- For skewed hangers 3 1/16" and less in width, the allowable download is 100% of the table load. For skewed hangers over 3 1/16" in width the allowable download is 80% of the table load. For slope only, the allowable download is 100% of the table load.
- For combined slopes and skews, the maximum allowable download is 0.80 of the table load.
- For sloped and skewed hangers, the flange on the acute side flange can be concealed at 0.80 of the table load. Contact Simpson Strong-Tie for skew limitations.
- See Hanger Options on pages 233-243 for additional information.
- See also HUS series.
- HUCQ cannot be modified.

Model configurations may differ from those shown. Some HU models do not have triangle holes. Contact Simpson Strong-Tie for details.

FACE MOUNT HANGERS HUS/HHUS/HGUS Double Shear SCL Hangers

See Hanger tables on pages 122-126. See Hanger Options on pages 233-243 for hanger modifications, which may result in reduced loads.

These hangers are designed for applications where higher loads are needed (*also see HUC and HUCQ*).

All hangers in this series have double shear nailing. This patented innovation distributes the load through two points on each joist nail for greater strength. It also allows the use of fewer nails, faster installation, and the use of common nails for all connections. (*Do not bend or remove tabs*)

MATERIAL: See tables on pages 122-126.

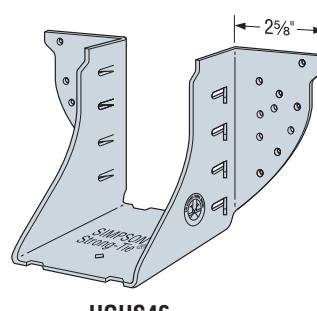

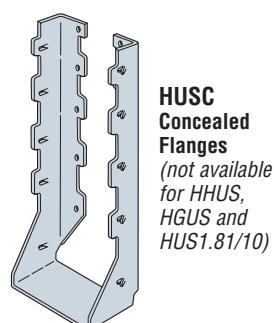

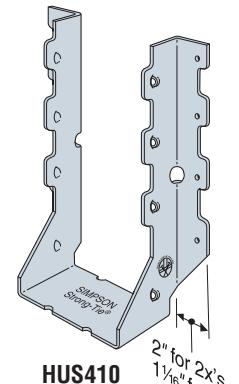

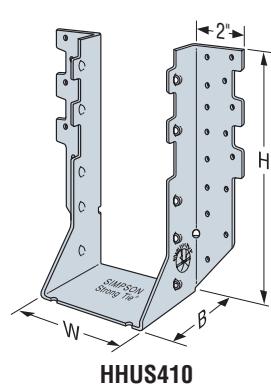

FINISH: Galvanized. Some products available in stainless steel or ZMAX®; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

- Do not use double shear hangers with I-joists.
- Nails must be driven at an angle through the joist or truss into the header to achieve the table loads.
- Not designed for welded or nailer applications.
- 16d sinkers (0.148" dia. x 3 1/4" long) may be used where 10d commons are specified with no reduction in load. Where 16d commons are specified, 10d commons or 16d sinkers (0.148" dia. x 3 1/4" long) may be used at 0.85 of the table load.
- With 3x carrying members, use 16dx2 1/2" (*Simpson Strong-Tie® N16*) nails into the header and 16d commons into the joist with no load reduction. With 2x carrying members, use 10dx1 1/2" nails into the header and 10d commons into the joist, and reduce the load to 0.64 of the table value.

OPTIONS: • HUS hangers available with the header flanges turned in for 3 1/2" wide joist only, with no load reduction. See HUSC Concealed Flange illustration.

- Concealed flanges are not available for HGUS, HUS1.81/10 and HHUS.
- See Hanger Options, pages 233-243, for sloped and/or skewed HHUS and HGUS models.
- Other sizes available; contact Simpson Strong-Tie for details.

- Uplift loads based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern. For SPF/HF use 0.86 x DF/SP uplift load.
- MIN nailing quantity and load values—fill all round holes; MAX nailing quantity and load values—fill all round and triangle holes.
- Hangers sorted in order of recommended selection for best overall performance and installation value.

- Web stiffeners are required where noted in the table or when the joist top flange isn't supported laterally by the hanger or when supporting double I-joists with flanges less than 1½" thick.
 - Allowable downloads are based on a joist bearing capacity of 750 psi.
 - NAILS:** 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.
- CODES:** See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- Uplift loads based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern. For SPF/HF use 0.86 x DF/SP uplift load.
- MIN nailing quantity and load values—fill all round holes;
MAX nailing quantity and load values—fill all round and triangle holes.
- Hangers sorted in order of recommended selection for best overall performance and installation value.

4. Web stiffeners are required where noted in the table or when the joist top flange isn't supported laterally by the hanger or when supporting double I-joists with flanges less than 1 $\frac{1}{16}$ " thick.

5. Allowable downloads are based on a joist bearing capacity of 750 psi.

6. **NAILS:** 16d = 0.162" dia. x 3 $\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long,
10dx1 $\frac{1}{2}$ = 0.148" dia. x 1 $\frac{1}{2}$ " long. See pages 22-23 for other nail sizes and information.

- Uplift loads based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern. For SPF/HF use 0.86 x DF/SP uplift load.
- MIN nailing quantity and load values—fill all round holes;
MAX nailing quantity and load values—fill all round and triangle holes.
- Hangers sorted in order of recommended selection for best overall performance and installation value.

4. Web stiffeners are required where noted in the table or when the joist top flange isn't supported laterally by the hanger or when supporting double I-joists with flanges less than 1½" thick.

5. Allowable downloads are based on a joist bearing capacity of 750 psi.

6. **NAILS:** 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long,
10dx1½ = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

CODES: See page 12 for Code Reference Key Chart.

FACE MOUNT HANGERS – STRUCTURAL COMPOSITE LUMBER

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

CODES: See page 12 for Code Reference Key Chart.

- Uplift loads based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern. For SPF/HF, use 0.86 x DF/SP Uplift Load for products requiring nails and 0.72 x DF/SP Uplift Load for products requiring screws.
- MIN nailing quantity and load values—fill all round holes;
MAX nailing quantity and load values—fill all round and triangle holes.

3. Hangers sorted in order of recommended selection for best overall performance and installation value.

4. Allowable downloads are based on a joist bearing capacity of 750 psi.

5. NAILS: 16d = 0.162" dia. x 3 1/2" long, 10d = 0.148" dia. x 3" long,
10dx1 1/2 = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

7x14 to 30	For additional hangers see HGU/HHGU on page 224.																

See footnotes on page 115.

THAI I-Joist & Structural Composite Lumber Hangers

Designed for I-joists, the THAI has extra long straps and can be field-formed to give height adjustability and top flange hanger convenience. Positive angle nailing helps eliminate splitting of the I-joist's bottom flange.

MATERIAL: THAI-2—14 gauge; all others—18 gauge **FINISH:** Galvanized

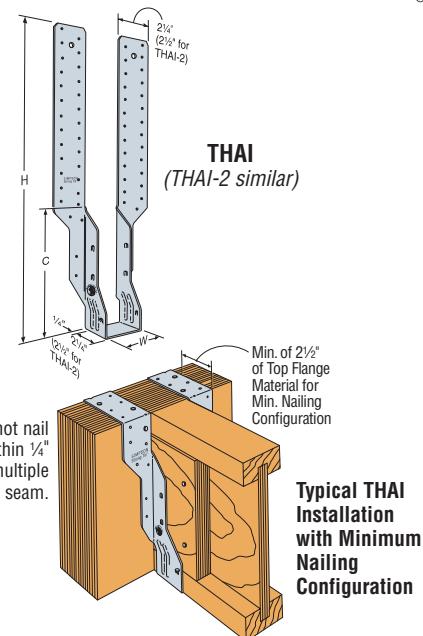

INSTALLATION: • Factory-order the THAI-2 for hanger width needed. See table for allowable widths.

- Use all specified fasteners. Verify that the header can take the fasteners specified in the table.
- Web stiffeners are required for all I-joists used with these hangers.
- When a total of 20 face nails are used in THAI straps, or 30 face nails are used in THAI-2 straps, the maximum load-carrying capacity is achieved.
- Reduce load given by allowable nail shear capacity for each nail less than maximum.
- A minimum nailing configuration is shown for top nailing installations. The strap must be field-formed over the top of the header by a minimum of $2\frac{1}{2}$ ".
- Uplift—Lowest face nails must be filled to achieve uplift loads.

CODES: See page 12 for Code Reference Key Chart.

Joist Dimensions		Model No.	Hanger Dimensions			Code Ref.
Width	Depth		W ¹	H	C	
1½	9¼ - 14"	THAI222	1⅞	22¾	9¾	
1¾	9¼ - 14"	THAI1.81/22	1⅓⅞	22¾	9¼	
2	9¼ - 14"	THAI2.06/22	2⅓⅞	22¾	9¾	
2⅓	9¼ - 14"	THAI2.1/22	2⅛	22¾	9¾	
2½ to 2⅓	9¼ - 14"	THAI3522	2⅔	22½	9	
2½	9¼ - 14"	THAI322	2⅔	22¾	8¾	
3½	9¼ - 14"	THAI422	3⅓	21⅜	8¾	
3 to 5¼	9¼ - 14"	THAI-2	3⅓ to 5⅓	21⅓	8⅓	

1. The W dimension should be ordered at $\frac{1}{16}$ " to $\frac{1}{8}$ " greater than the joist width.

Nailing Options	Fasteners			Allowable Loads									
	Top	Face	Joist	Uplift (160)	LVL Header			DF/SP Header			SPF/HF Header		
					Floor (100)	Snow (115)	Roof (125)	Floor (100)	Snow (115)	Roof (125)	Floor (100)	Snow (115)	Roof (125)
THAI Minimum	4-10dx1½	2-10dx1½	2-10dx1½	—	1400	1400	1400	1400	1400	1400	1060	1060	1060
	4-10d	2-10d	2-10dx1½	—	1715	1715	1715	1835	1835	1835	1590	1590	1590

THAI-2 Minimum	4-10d	2-10d	2-10dx1½	—	2020	2020	2020	2020	2020	2020	2020	2020	2020
THAI-2 Maximum	—	30-10d	2-10dx1½	215	3390	3900	4135	3390	3900	4135	2940	3310	3310

1. Uplift loads are based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern. For SPF/HF use 0.86 x DF/SP uplift load.

2. The minimum header depth to achieve the maximum nail configuration is 16".

3. For the THAI3522 supporting a 2¼" joist, the download shall be the lesser of the table load or 1400 lbs.

4. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information

LGU/MGU/HGU/HHGU High-Capacity Girder Hangers

The GU hangers are a high-capacity girder hangers designed for situations where the header and joist are flush at top. This part can be used for retrofit on the framing members after they are temporarily placed in position. It uses Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws to make installation fast and easy, with no pre-drilling required.

MATERIAL: See table **FINISH:** Galvanized, HHGU—Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners. See General Notes.

- Install with $\frac{1}{4} \times 2\frac{1}{2}$ " Strong-Drive SDS Heavy-Duty Connector screws, which are provided with the GU's. (Note: lag screws will not achieve the same loads.)
- All multiple members must be fastened together to act as a single unit.
- Multiple member headers may require additional fasteners at the hanger locations. The quantity and location of the additional fasteners must be determined by the Designer.

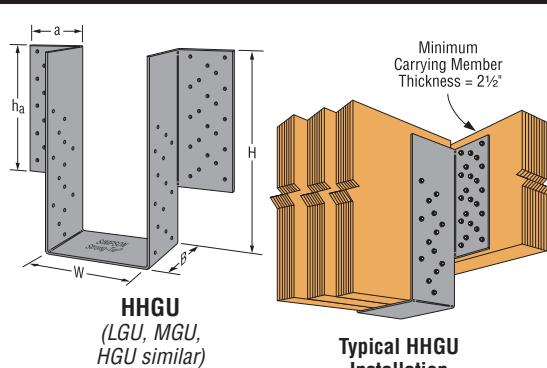

OPTIONS: • Hot-dip galvanized available. Order as "X" version, specify HDG.

- Other seat widths available. Order as "X" version, specify width.
- See Hanger Options, pages 233-243, for one flange concealed option. MGU with W 4" or less and HGU with W 4½" or less cannot be concealed.
- LGU, MGU and HGU hangers may be skewed up to 45°. See page 243.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Uplift loads have been increased for earthquake and wind loading, with no further increase allowed.

2. Specify H dimension. Maximum H = 30".

3. Header height must be at least as tall as flange height (h_a).

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

Simpson Strong-Tie offers a dedicated range of top flange I-joist hangers that meet the unique needs of I-joints while offering superior performance and ease of installation.

ITS

The innovative ITS sets the standard for engineered wood top flange hangers. The ITS installs faster and uses fewer nails than any other EWP top flange hanger. The new Strong-Grip™ seat and Funnel Flange™ features allow standard joist installation without requiring joist nails resulting in the lowest installed cost. The Strong-Grip seat firmly secures I-joints with flange thicknesses from $1\frac{1}{8}$ " to $1\frac{1}{2}$ ".

MIT/HIT - Positive Angle Nailing (PAN)

PAN is specifically designed for I-joints when used with the MIT or HIT. With PAN, the nail hole material is not removed, but is formed to channel and confine the path of the nail at approximately 45°. PAN minimizes splitting of the flanges while permitting time-saving nailing from a better angle. See Top Flange tables on pages 124-132.

Refer to Joist Manufacturer's literature or appropriate Simpson Strong-Tie® Connector Selection Guide for actual joist sizes.

MATERIAL: ITS—18 gauge; MIT, HIT—16 gauge

FINISH: Galvanized

INSTALLATION:

- Use all specified fasteners. Verify that the header can take the required fasteners specified in the table.
- See product specific installation drawings on pages 108-109.
- ITS—no joist nailing required for standard I-joist installation without web stiffeners. When supporting I-joints with web stiffeners or rectangular SCL member $2\text{-}10\text{dx}1\frac{1}{2}$ " must be installed into optional triangle joist nail holes for standard installation values.
- ITS—optional triangle nail holes may be used for additional load. See allowable load tables. Refer to technical bulletin T-OPTUPLIFT for additional options.
- MIT—optional triangle nail holes may be used for increased uplift capacity. See Optional Nailing For Increased Uplift table.
- HIT—closed PAN nail holes may be used for increased uplift capacity. See Optional Nailing For Increased Uplift table.
- For sloped joists up to $1/4:12$ there is no reduction, between $1/4:12$ and up to $1/2:12$, tests show a 10% reduction in ultimate hanger strength. Local crushing of the bottom flange or excessive deflection may be limiting; check with joist manufacturer for specific limitations on bearing of this type.

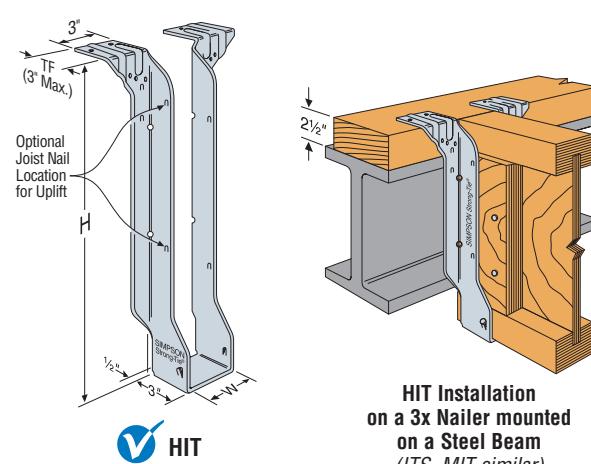

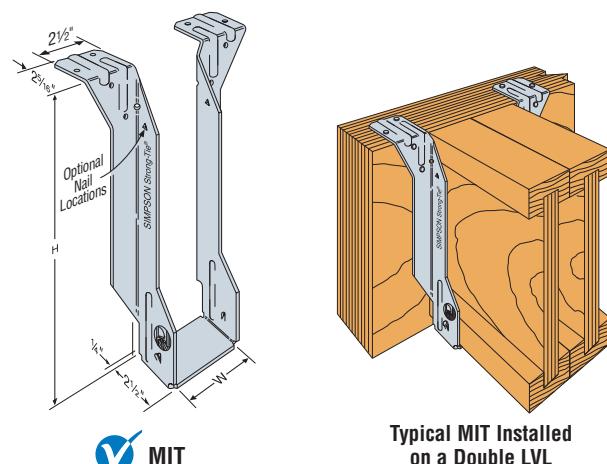

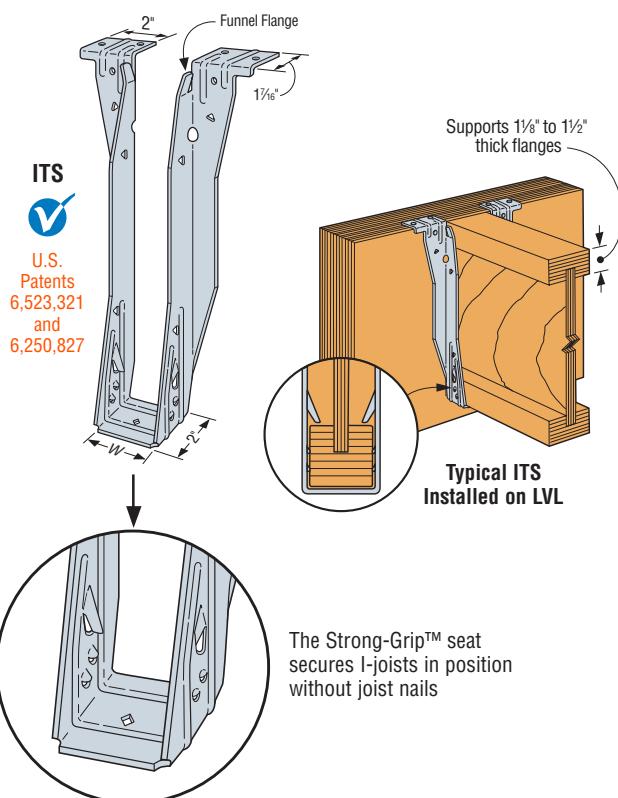

ALLOWABLE LOADS:

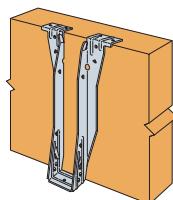

- The ITS, MIT and HIT hangers have locations for optional nails if additional uplift is needed. Optional uplift nailing requires the addition of properly-secured web stiffeners. See the load tables for minimum required fasteners and allowable uplift loads.

OPTIONS:

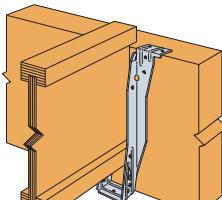

- Because these hangers are fully die-formed, they cannot be modified. However these models will normally accommodate a skew of up to 5°.

CODES: See page 12 for Code Reference Key Chart.

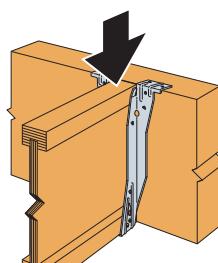

TOP FLANGE HANGERS ITS/MIT/HIT Engineered Wood Products Hangers**ITS INSTALLATION SEQUENCE**

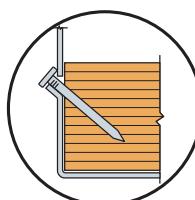

STEP 1
Attach the ITS
to the header

STEP 2
Slide the I-joist downward into the ITS
until it rests above the Strong-Grip™ seat.

STEP 3
Firmly push or snap I-joist
fully into the seat of the ITS.

1. Loads may not be increased for duration of load.
2. Uplift loads are based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern. For SPF/HF use 0.86 x DF/SP uplift load.
3. ITS uplift loads are valid for all lumber species and need not be reduced for duration of load.
4. Applies to LVL headers made primarily from Douglas Fir or Southern Pine. For LVL made primarily from Spruce Pine Fir or similar less dense veneers, use the values found in the SPF/HF column.
5. DF I-joists include flanges made from solid sawn Douglas Fir, LVL made primarily of Douglas Fir/Southern Pine, or LSL. For flanges with thicknesses from $1\frac{1}{16}$ to $1\frac{1}{8}$, use 0.85 of the I-joist header load. For flanges with thicknesses from $1\frac{1}{8}$ to $1\frac{1}{4}$, use 0.75 of the I-joist header load.
6. SCL (structural composite lumber) is LVL, LSL, and Parallam® PSL.
7. Web stiffeners required for the ITS Alternate Installation when installing optional joist nails for additional uplift load.
8. Code Values are based on DF/SP header species.
9. I-joists with flanges less than $1\frac{1}{16}$ thick used in combination with hangers thinner than 14 gauge may deflect an additional $\frac{1}{32}$ inch beyond the standard $\frac{1}{8}$ limit.
10. For $2\frac{1}{4}$ " and $2\frac{7}{16}$ " wide joists, see tables on page 125 for allowable loads.

Parallam® is a registered trademark of Weyerhaeuser.

NAILS: 16d = 0.162 " dia. x $3\frac{1}{8}$ " long, $16dx2\frac{1}{2}$ = 0.162 " dia. x $2\frac{1}{2}$ " long,
10d = 0.148 " dia. x 3 " long, $10dx1\frac{1}{2}$ = 0.148 " dia. x $1\frac{1}{2}$ " long.
See pages 22-23 for other nail sizes and information.

NAILER TABLE

This table indicates various allowable loads for ITS/MIT/HIT hangers used on wood nailers. The header nail type must be substituted for those listed in other tables. See technical bulletin T-NAILERUPLFT for other uplift values and options.

	4-16d	6-16d	6-10dx1½	850

1. Loads are based on Doug Fir, and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Web stiffeners are required on I-joist for additional nailing.

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The BA hanger is a cost effective hanger targeted at high capacity I-joints and common Structural Composite Lumber applications. A min/max joist nail option gives dual use of this hanger. Minimum values featuring positive angle nailing are targeted at I-joist without web stiffeners requirement and the maximum nailing generates higher loads to support structural composite lumber. The unique two level embossment provides added stiffness to the top flange.

The newly improved LBV, B and HB hangers offer wide versatility for I-joists and structural composite lumber. The enhanced load capacity widens the range of applications for these hangers. The LBV still features positive angle nailing and does not require the use of web stiffeners for standard non modified I-joist installations.

See Top Flange tables on pages 124-132. See Hanger Options on pages 233-243 for hanger modifications, which may result in reduced loads.

MATERIAL: See tables on pages 124-132.

FINISH: LBV, B, BA and HB—Galvanized; all saddle hangers and all welded sloped and special hangers—Simpson Strong-Tie® gray paint. LBV, B, BA and HB may be ordered hot-dip galvanized; specify HDG.

INSTALLATION: • Use all specified fasteners. See General Notes and nailer table.

- LBV, B, BA and HB may be used for weld-on applications. Weld size to match material thickness (*approximate thickness shown*). The minimum required weld to the top flanges is $\frac{1}{8}$ " x 2" fillet weld to each side of each top flange tab for 14 and 12 gauge and $\frac{3}{16}$ " x 2" fillet weld to each side of each top flange tab for 7 gauge and 10 gauge. Distribute the weld equally on both top flanges. Welding cancels the top and face nailing requirements. Consult the code for special considerations when welding galvanized steel. The area should be well-ventilated, see page 17 for weld information. Weld on applications produce the maximum allowable down load listed. For uplift loads refer to technical bulletin T-WELDULPT.
- LBV hangers do not require the use of web stiffeners for non-sloped or non-skewed applications.
- B and HB hangers require the use of web stiffeners. BA MIN nailing does not require web stiffeners. BA MAX nailing requires the use of web stiffeners.
- Ledgers must be evaluated for each application separately. Check TF dimension, nail length and nail location on ledger.
- Refer to technical bulletin T-SLOPEJST for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes ($\leq \frac{3}{4}:12$).

OPTIONS: • LBV, B and HB

- Other widths are available; specify W dimension (*the minimum W dimension is $1\frac{1}{16}$ "*).
- The coating on special B hangers will depend on the manufacturing process used. Check with your Simpson Strong-Tie representative for details.
- Hot-dip galvanized available: specify HDG.
- Refer to technical bulletin T-BSERIES for the complete line of LBV, BA, B and HB hangers, including models not shown here, their available modification combinations and their associated reduction factors.
- Modified hangers have reduced loads, see Hanger Options, pages 233-243.

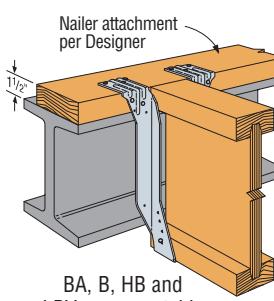

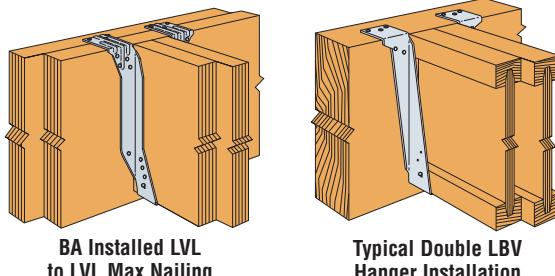

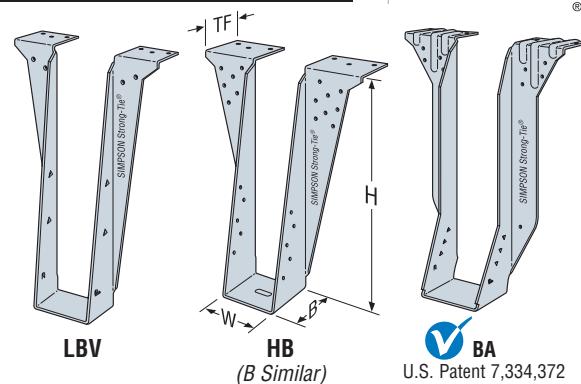

CODES: See page 12 for Code Reference Key Chart.

Model No.	Nailer	Top Flange Nailing	Uplift ¹ (160)	Allowable Loads

	HB	22-16d	1550	5500	—

NAILER TABLE

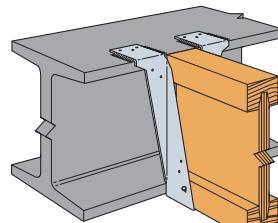

The table indicates the maximum allowable loads for LBV, BA, B and HB hangers used on wood nailers. Nailers are wood members attached to the top of a steel I-beam, concrete or masonry wall.

1. Uplift values are for DF/SP members only. LBV and BA hangers resist more uplift when web stiffeners are used. Refer to technical bulletin T-NAILERULPT for additional information.
2. See page 239 for reductions on modified hangers on nailers.
3. B hangers require 6-10dx1 $\frac{1}{2}$ joist nails to achieve published loads. For joist members 2 $\frac{1}{2}$ " or wider, 16dx2 $\frac{1}{2}$ " joist nails should be installed for additional uplift loads on the 3x and 4x nailer applications of 970 lbs. and 1010 lbs., respectively.

BA, B, HB and LBV are acceptable for nailer applications (BA shown on 2x nailer)

NAILS: 16d = 0.162" dia. x 3 $\frac{1}{2}$ " long, 16dx2 $\frac{1}{2}$ = 0.162" dia. x 2 $\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, 10dx1 $\frac{1}{2}$ = 0.148" dia. x 1 $\frac{1}{2}$ " long. See pages 22-23 for other nail sizes and information.

BA, B, HB and LBV are acceptable for weld-on applications (LBV shown). See Installation Information.

1. This table assumes joists with $F_{cL} = 750$ psi. For other joists, check that bearing and joist nails are adequate.
2. Loads for B's and HB's assume a joist width of 2 $\frac{1}{2}$ " or greater.
3. Uplift loads are based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern. For SPF/HF use 0.86 x DF/SP uplift load.
4. Loads may not be increased for short term loading.
5. Web stiffeners required when more than two joist nails are used.
6. SCL (structural composite lumber) is LVL (laminated veneer lumber), LSL (laminated strand lumber), and Parallam® PSL.
7. Code values are based on DF/SP header species.
8. Applies to LVL headers made primarily from Douglas Fir or Southern Pine. For LVL made primarily from Spruce-Pine-Fir or similar less dense veneers, use the values found in the SPF/HF column.
9. DF I-joists include flanges made from solid sawn Douglas Fir, LVL made primarily of Douglas Fir/Southern Pine, or LSL. For flanges with thicknesses from 1 $\frac{1}{16}$ " to 1 $\frac{1}{8}$ ", use 0.85 of the I-joist header load. For flanges with thicknesses from 1 $\frac{1}{8}$ " to 1 $\frac{1}{4}$ ", use 0.75 of the I-joist header load.

Parallam® is registered trademark of Weyerhaeuser.

TOP FLANGE HANGERS W/WP/WPU/WM/WMU/HW/HWU*I-Joist & Structural
Composite Lumber Connectors*

The W, WP, WPU, HWU and HW series are designed to hang joists, purlins or beams. WM and WMU hangers are designed for use on standard 8" grouted masonry block wall construction. Some models have an "I" in the model number which indicates a size specific for an I-Joist and have the same properties and modifications as the standard series.

MATERIAL: See tables on pages 124-132.

FINISH: Simpson Strong-Tie® gray paint; HDG available. Contact Simpson Strong-Tie.

INSTALLATION: • Use all specified fasteners. WM—two 16d duplex nails must be installed into the top flange and embedded into the grouted wall. Verify that the header can take the required fasteners specified in the table.

- Hangers may be welded to steel headers with $\frac{1}{8}$ " for W, $\frac{3}{16}$ " for WP, WPU, and $\frac{1}{4}$ " for HW, HWU by $1\frac{1}{2}$ " fillet welds located at each end of the top flange, see page 17 for weld information. Weld-on applications produce maximum allowable load listed. For uplift loads refer to technical bulletin T-WELDULPT (WPU and HWU hangers only).
- Hangers can support multi-ply carried members; the individual members must be secured together to work as a single unit before installation into the hanger.
- Hangers can support joists sloped up to $1/4:12$ using table loads. For joists sloping between $1/4:12$ and $3/4:12$ use 85% of the table loads.
- Web stiffeners are required for standard joist nailing configuration with these hangers.
- **WM/WMU MID-WALL INSTALLATION:** Installed between blocks with duplex nails cast into grout with a minimum of one grouted course above and below the top flange grouted and one #5 vertical rebar minimum 24" long in each adjacent cell.
- **WM/WMU TOP-OF-WALL INSTALLATION:** Install on top of wall to a grouted beam with Titen® masonry screws.

OPTIONS: • See Hanger Options, pages 233-243 for hanger modifications and associated load reductions.

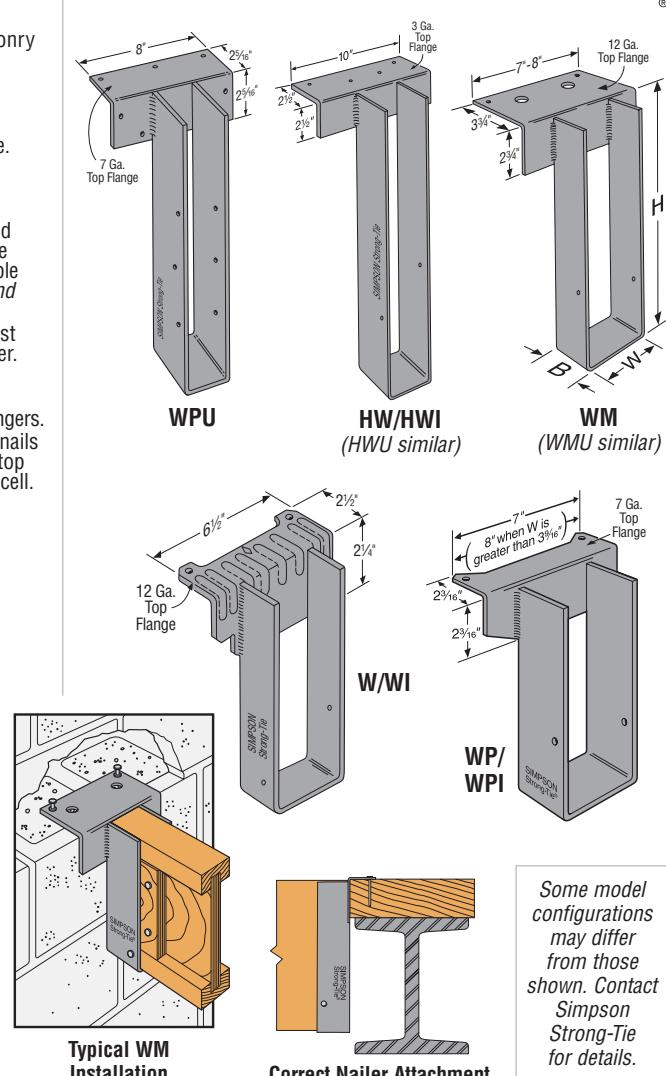

CODES: See page 12 for Code Reference Key Chart.

NAILER TABLE

The table indicates the maximum allowable loads for W, WP and HW hangers used on wood nailers. Nailers are wood members attached to the top of a steel I-beam, concrete or masonry wall.

1. Uplift values for the WPU and HWU hangers are for depths $\leq 18"$ and are for DF/SP values only. Refer to uplift values in table below for taller depths.
2. Attachment of naler to supporting member is the responsibility of the Designer.

Some model configurations may differ from those shown. Contact Simpson Strong-Tie for details.

	4½ to 7	28½ to 32	4-16d	4-16d	8-10dx1½	985	6000	5500	5535	6000	5415	—	—	

1. Uplift loads are based on DF/SP lumber and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™ software or conservatively divide the uplift load by 1.6. For SPF/HF use 0.86 x DF/SP uplift load.

2. Applies to LVL headers made primarily from Douglas Fir or Southern Pine. For LVL made primarily from Spruce Pine Fir or similar less dense veneers, use the values found in the SPF/HF column.

3. WP quantity of nail holes in top flange varies.

4. Top Flange Hangers on the following pages with "I" in the model name (e.g. HWI) use the same design information in the above tables for the models without the "I" in the name (e.g. HW).

5. Minimum f'm = 1500 psi. See Installation Notes on page 173.

6. For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.

7. **NAILS:** 16d and 16d DPLX = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information. **Parallam®** is a registered trademark of Weyerhaeuser.

GLTV/HGLTV Heavy Duty Hangers

GLTV and HGLTV hangers are designed for structural composite lumber header applications that require high loads. The top flange nails are sized and specifically located to prevent degradation of the header due to splitting of laminations.

For heavy loads with a face-mount application, see the HGUS and GU series.

MATERIAL: Top flange—3 gauge; Stirrups—7 gauge

FINISH: Simpson Strong-Tie® gray paint; HDG available. Contact Simpson Strong-Tie.

INSTALLATION: • Use all specified fasteners. Verify that the header can take the required fasteners specified in the table.

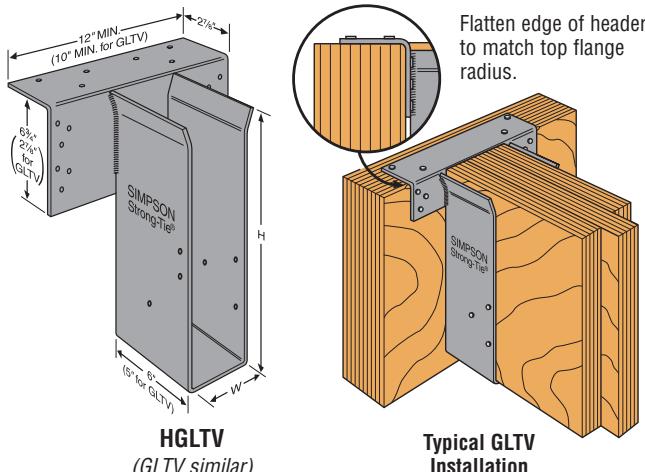

- This series may be used for weld-on applications. Minimum required weld is a $\frac{3}{16}$ " x $2\frac{1}{2}$ " fillet weld at each end of the top flange for GLTV, and a $\frac{1}{4}$ " x $2\frac{1}{2}$ " fillet weld at each end of the top flange for HGLTV, see page 17 for weld information. Weld-on applications produce maximum loads listed. For uplift loads refer to T-WELDULPTL.

- Web stiffeners are required with I-joists using this hanger style.
- GLTV or HGLTV hangers may be installed on ledgers provided the ledgers are made of 4x solid sawn or $3\frac{1}{2}$ " SCL shown in the table below. Thinner lumber must be evaluated by the building Designer.
- HGLTV hangers should not be attached to nailers.

OPTIONS: • Hot-dip galvanized: specify HDG.

- See Hanger Options, pages 233-243. Saddle hanger versions are available in some engineered wood sizes.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Fasteners			Allowable Loads Header Type						Code Ref.

HGLTV series	6-16d	12-16d	6-16d	1295	10585	9485	9500	8835	6770	—

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Uplift loads only apply when "H" is 28" or less. Uplift loads for nailing applications is limited to 710 lbs.
3. For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.

4. Applies to LVL headers made primarily from Douglas Fir or Southern Pine. For LVL made primarily from Spruce Pine Fir or similar less dense veneers, use the values found in the SPF/HF column.
5. Nailer shall be minimum 2-2x, 3x or 4x DF/SP. Use 16dx2½" nails.
6. For SCL products made primarily from Douglas Fir or Southern Pine use 1640 lbs. for uplift. For SPF member use 1115 lbs. for uplift.
7. **NAILS:** 16d = 0.162" dia. x 3½" long. See pages 22-23 for other nail sizes and information.

EGQ High Capacity Hanger

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The EGQ hanger is a high capacity top flange connector designed for use with Structural Composite Lumber beams. It utilizes Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws for higher capacity and ease of installation. Available in standard SCL widths and made to specified heights. SDS screws are included.

MATERIAL: Top flange—3 gauge; Stirrups—7 gauge
FINISH: Simpson Strong-Tie gray paint; HDG available.

Contact Simpson Strong-Tie.

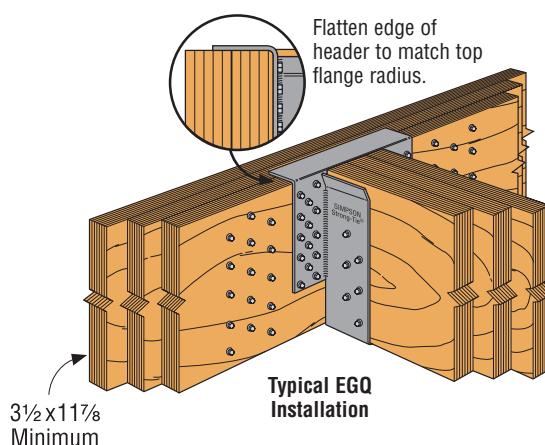

INSTALLATION: • Use all specified fasteners. See General Notes.

- Install with $\frac{1}{4}$ " x 3" Strong-Drive SDS Heavy-Duty Connector screws, which are provided with the EGQ. (Lag screws will not achieve the same load.)
- All multiple members must be fastened together to act as a single unit.
- Multiple member headers may require additional fasteners at hanger locations. Quantity and location to be determined by designer. See Strong-Drive SDS Heavy-Duty Connector screw section for additional information and applications.

OPTIONS: • See Hanger Options pages 233-243.

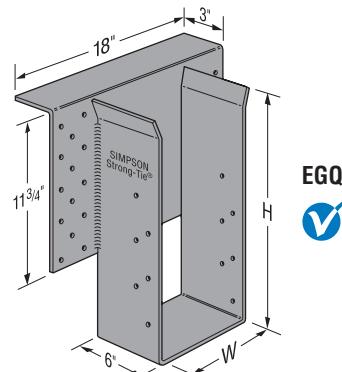

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Joist or Purlin Size	Dimensions		Fasteners		Allowable Loads Header Type				Code Ref.
		W	Min H	Header	Joist	Uplift (160)	LVL/LSL	PSL	DF/SP	
EGQ3.62-SDS3	3½	3½	11½	28-SDS ¼"x3"	12-SDS ¼"x3"	6365	19800	18680	19800	I19, L14
EGQ5.50-SDS3	5½	5½	11½	28-SDS ¼"x3"	12-SDS ¼"x3"	6365	19800	18680	19800	
EGQ7.25-SDS3	7	7½	11½	28-SDS ¼"x3"	12-SDS ¼"x3"	6365	19800	18680	19800	

1. Loads are based on 750 psi wood bearing for SCL.
2. "Min H" is the minimum H dimension that may be specified.
3. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. For normal loading such as in cantilever construction use an uplift value of 4800 lbs.

MSC Multiple Seat Connector

The MSC supports the ridge and two valleys for roof construction. Ideal for dormer roof applications.

MATERIAL: Top flange—3 gauge, Stirrups—11 gauge (MSC2 and MSC1.81), 7 gauge (MSC4 and MSC5)

FINISH: Simpson Strong-Tie® gray paint; HDG available. Contact Simpson Strong-Tie.

INSTALLATION: • Distribute the total load evenly about the centerline to avoid eccentric loading.

- Fasten all built-up members together as one unit.
- Net height will be calculated based on specified valley member depth and slope by the factory unless noted otherwise.

SLOPED AND/OR SKEWED VALLEYS

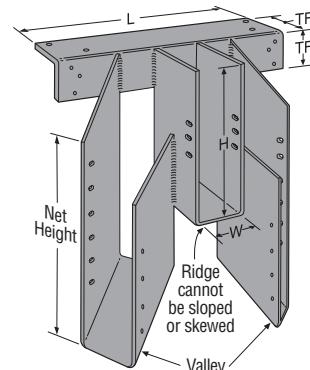

- The valley stirrups can be sloped down to 45° and skewed from 25° to 45°. (MSC5 skewed 20°-45°.)
- The total design load of the hanger is split between the ridge (20%) and each valley (40%).
- MSC connectors can be used for two valley connections with no ridge member. Divide the total load by two for each valley load.
- Many combinations of joist sizes, slopes and skews can be manufactured (refer to worksheet T-MSC-WS).

CODES: See page 12 for Code Reference Key Chart.

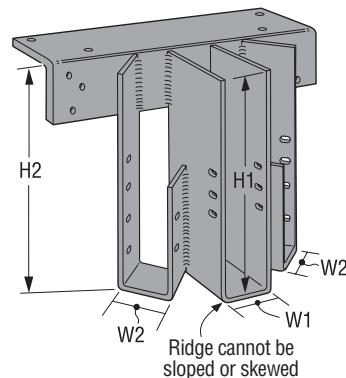

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Loads may not be increased for duration of load.
2. Uplift loads are based on DF/SP lumber and have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern. For SPF/HF use 0.86 x DF/SP uplift load.
3. When I-joist is used as header, all nails must be 10dx1½ and allowable loads assume flanges that are at least 1½" thick made of Douglas Fir, LVL or LSL. For other flange thicknesses, apply load adjustment factors found in the table below.
4. Hangers sorted in order of recommended selection for best overall performance and installation value.
5. Other nail schedules and loads are listed on pages 121-123.
6. See pages 119-122 for Code reference numbers.
7. Web stiffeners are required where noted and when supporting double I-joists with flanges less than 1½" thick in hangers that are 14 gauge and thinner.
8. For 2½" x 22" and 24" joist sizes, refer to technical bulletin T-BSERIES.
9. NAILS: 16d = 0.162" dia. x 3½" long,
10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long.
See pages 22-23 for other nail sizes and information.

Flange Material or Thickness	Hanger Series

See footnotes on page 124.

RC Ripper Clip

The Ripper Clip is designed to connect ripped 2x framing to the top of another wood joist.

MATERIAL: 20 gauge **FINISH:** Galvanized

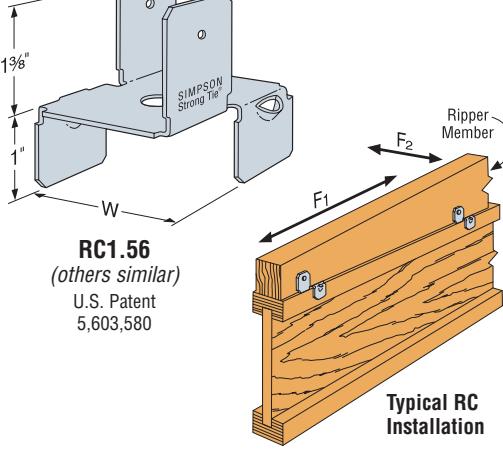

INSTALLATION: • Use all specified fasteners. Refer to General Notes.

- Attach RC to ripper, then attach ripper/RC assembly to roof joist.

CODES: See page 12 for Code Reference Key Chart.

Model No.	W (in.)	Fasteners		Allowable Uplift Load (160)	F ₁	F ₂	Code Ref.
		Ripper	Joist				
RC1.56	1 1/16			205	240	205	170
RC1.81	1 1/8	2-10dx1 1/2	2-10dx1 1/2				
RC2.1	2 1/8						

1. Allowable loads are for DFL ripper members.
2. Uplift loads have been increased for wind or earthquake loading with no other increase allowed. Reduce where other loads govern.
3. Designer to consider stability/blocking requirements for system, if necessary.
4. Spacing of RC per Designer.
5. **NAILS:** 10dx1 1/2 = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

DU/DHU/DHUTF Drywall Hanger

The DU/DHU face-mount and the DHUTF top-mount hangers are designed to carry joist floor loads to a wood stud wall through two layers of $\frac{5}{8}$ " gypsum board (drywall). These hangers install after the drywall is in place. The hangers come in sizes that accommodate most joists used in multi-family construction including I-joists and trusses.

MATERIAL: DU—14 gauge; DHU and DHUTF—12 gauge

FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws are provided with the hanger.
- Drywall is installed first.
- DU and DHU are mounted with top of hanger flush with top of wall and tight to the drywall.
- Wall top plates must be restrained to prevent rotation. Use an SSP stud plate tie connector at the back of each stud or provide equivalent restraint by another method as determined by Designer.
- Upper plate splices must occur at a stud location.

OPTIONS: • The DHU may be ordered with one flange concealed for widths at least $2\frac{1}{2}$ " wide; specify which flange when ordering. Use 74% of the table downloads and 100% of table uplift loads.

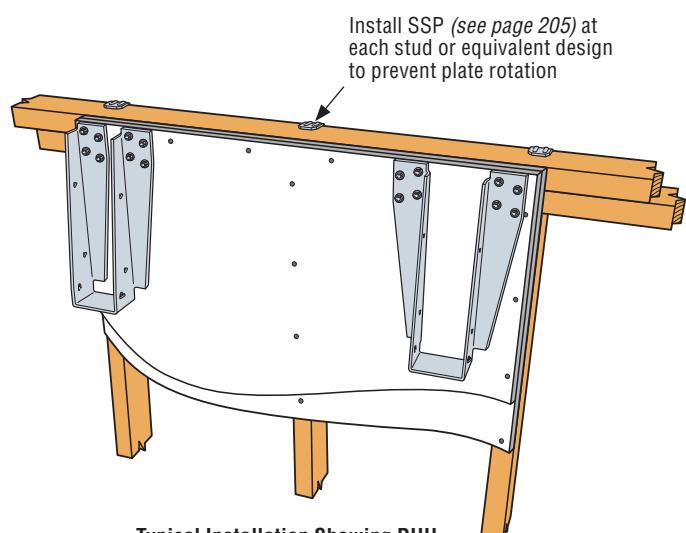

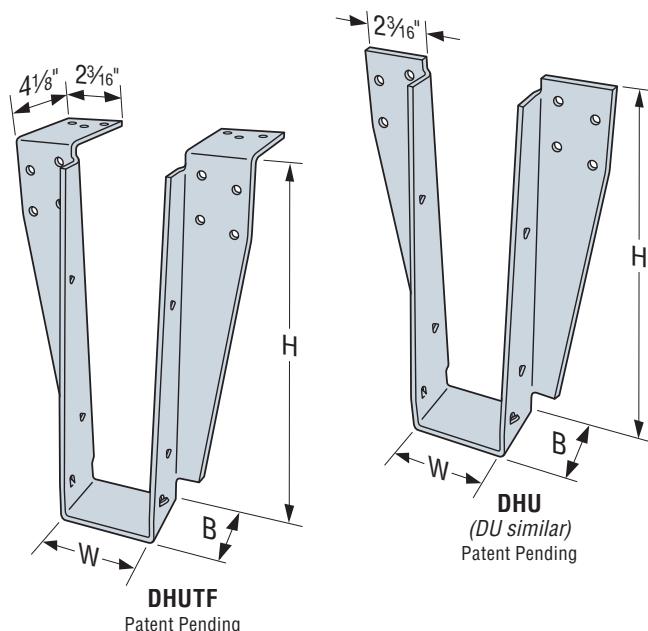

CODES: See page 12 for Code Reference Key Chart.

Fastener Table

Model	Gauge	B	Fasteners		
			Joist	Face	Top

	Over (1) layer $\frac{5}{8}$ " structural sheathing and (2) layers $\frac{5}{8}$ " drywall	95	1975	170	1660	

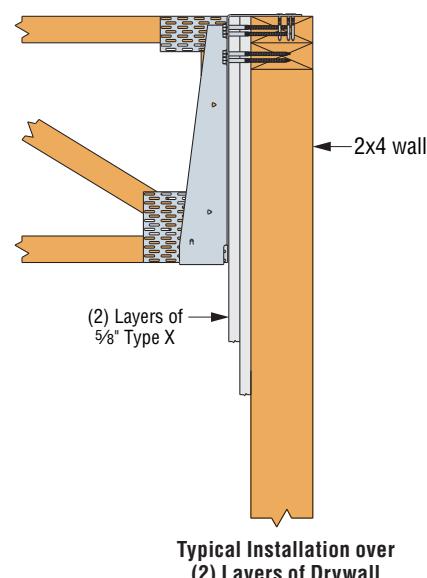

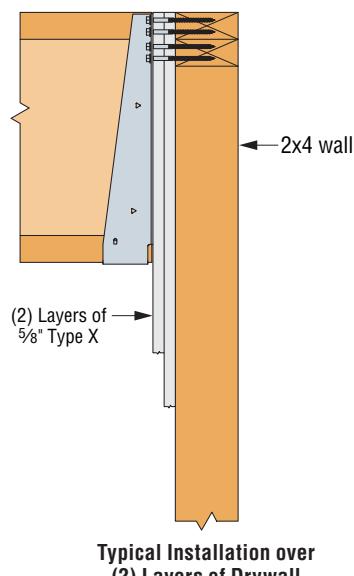

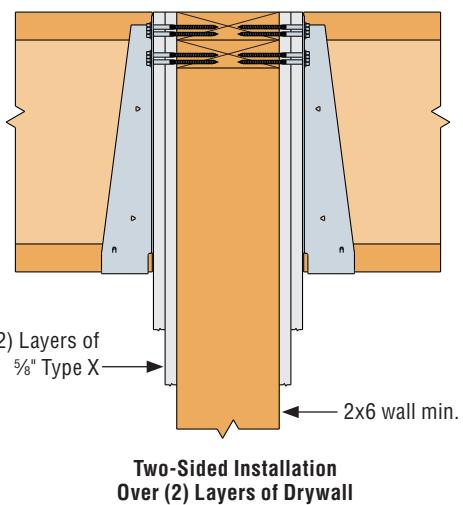

Typical Installation Showing DHU with Concealed Flange Option (at left) and a DHU Standard Installation

1. Loads assume $\frac{5}{8}$ " Type X drywall attached per IBC. Wall assembly must consist of minimum two 2x4 plate members with studs spaced not more than 16" o.c. For alternate solutions to mounting over single layer of drywall, refer to the technical bulletin T-C-TFWALL13 at www.strongtie.com.
2. Hangers spaced closer than 16" o.c. shall reduce capacity proportionately.
3. Triangle nail holes may be filled with (4) additional 10dx $1\frac{1}{2}$ " to achieve an Allowable Uplift Load of 750 lbs.
4. DF carried members with minimum $1\frac{1}{2}$ " x $2\frac{1}{2}$ " solid sawn chord dimension may increase Allowable Uplift Load to 170 lbs.
5. Allowable downloads may be increased to 1885 lbs. for DF/SP and 1585 lbs. for SPF/HF using the DHU3.56/24 or DHUTF3.56/24 models.

HRC Hip Ridge Connectors

For complementary top plate connection, see page 138

The HRC series are field slopeable connectors that attach hips to ridge members or trusses. The HRC may be sloped to 45° with no reduction in loads.

MATERIAL: 16 gauge**FINISH:** Galvanized**INSTALLATION:**

- Use all specified fasteners. See General Notes.
- On end of ridge—use optional diamond holes to secure the HRC. Bend face flanges back flush with ridge, and complete nailing.
- On face of ridge—adjust to correct height and install nails.
- Double bevel-cut hip members to achieve full bearing capacity.
- The HRC may be sloped to 45° with no reduction in loads.

CODES: See page 12 for Code Reference Key Chart.

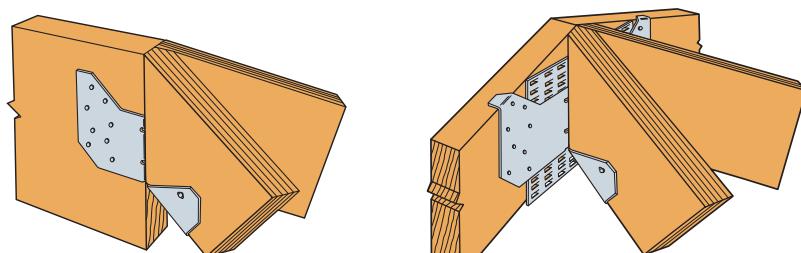

HRC1.81

U.S. Patent
5,380,116

Model No.	W	Member Size		Fasteners		DF/SP Allowable Loads				SPF/HF Allowable Loads				Code Ref.
		Hip	Ridge	Carrying Member	Each Hip	Uplift (160)	Floor (100)	Snow (115)	Roof (125)	Uplift (160)	Floor (100)	Snow (115)	Roof (125)	
HRC1.81	1 13/16	1 3/4"	2x or 1 3/4" wide	16-10dx1 1/2	2-10dx1 1/2	290	720	830	900	250	625	720	780	I8, L15, F7

1. Allowable loads shown are for each hip. Total load carried by the connector is double this number.
2. Uplift loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
3. Roof loads are 125% of floor loads unless limited by other criteria.
4. **NAILS:** 10dx1 1/2 = 0.148" dia. x 1 1/2" long.
See pages 22-23 for other nail sizes and information.

For additional SCL sizes,
see page 98.

Typical HRC Installation
on the End of a RidgeOptional
HRC1.81 Installation**SUR/SUL/HSUR/HSUL Skewed 45° Hangers for I-Joist and SCL**

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The SUR/L1.81, 2.06, 2.1, 2.37, 2.56 and HSUR/L series are 45° skewed hangers designed specifically to ease the installation of single and double I-joists. In addition to Positive Angle Nailing these hangers encapsulate the top flange of the I-joist, so no web stiffeners are required for standard installation.

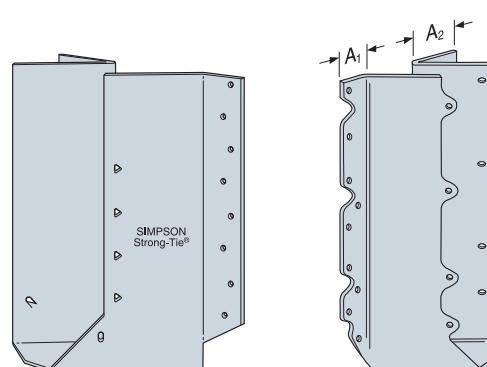

The full range of 45° skewed hangers feature obround nail holes on the acute side allowing nails to be easily installed parallel to the joist. Installation is further simplified with no required bevel cuts.

MATERIAL: See table on page 136.**FINISH:** Galvanized. Some products available in ZMAX® coating;
see Corrosion Information, pages 13-15.**INSTALLATION:** • Use all specified fasteners. See General Notes.

- Illustrations show left and right skews SUR/L (*SUR* = skewed right; *SUL* = skewed left).
- The joist end may be square cut or bevel cut.
- Fill all round and obround nail holes with specified fasteners to achieve table loads. Where noted, triangle holes in the joist flange may be filled for additional uplift capacity (see footnote on page 136).
- For I-joists with flanges less than 1 1/8", web stiffeners are required for all double joist hangers when using hangers that are 14 gauge and lighter.
- For installations to masonry or concrete, see page 175.

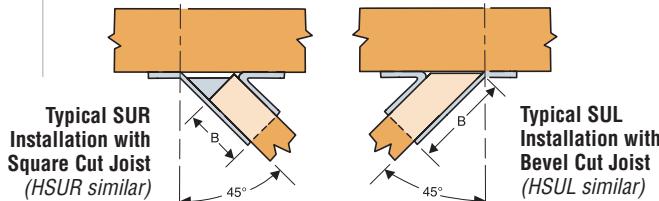

OPTIONS: • These hangers will accommodate a 40° to 50° skew.

- Available with the A₂ flange turned in on 2-2x and 4x models only (see illustration). For example, specify HSURC410, HSULC410, SURC210-2, or SULC210-2.

CODES: See page 12 for Code Reference Key Chart.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. Triangle nail holes may be filled (requires web stiffeners) with 10dx1 ½" nails for additional uplift.

• SUR/SUL 9- and 11-inch, SUR/L4.12/14 and all HSUR/HSUL models have additional holes, that when filled can resist 795 lbs. for Douglas Fir or Southern Pine or 685 lbs. for SPF/HF.

• SUR/SUL 14-inch models have (6) additional holes, that when filled can resist 1190 lbs. for DF/SP and 1025 lbs. for SPF/HF.

3. When the supported member is an I-joist with flanges less than 1½" inches thick, the allowable uplift shall not exceed 190 lbs. without web stiffeners.

4. Allowable downloads are based on a joist bearing capacity of 750 psi.

5. **NAILS:** 16d = 0.162" dia. x 3½" long, 10dx1 ½" = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

This series attaches joists or rafters to headers, sloped up or down, and skewed left or right, up to 45°.

MATERIAL: See table

FINISH: Galvanized

INSTALLATION: • Use all specified fasteners.

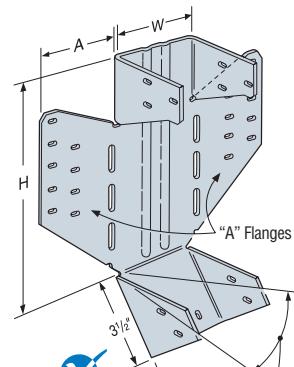

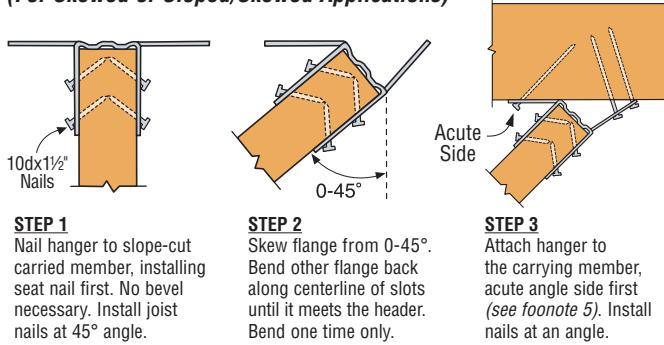

See General Notes.

- Attach the sloped joist at both ends so that the horizontal force developed by the slope is fully supported by the supporting members.
- Web stiffeners required for I-joint applications.
- To see an installation video on this product, visit www.strongtie.com.

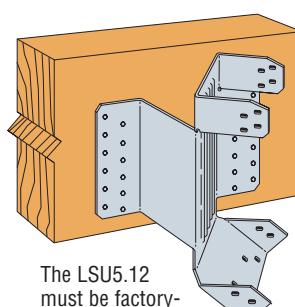

CODES: See page 12 for Code Reference Key Chart.

LSU and LSSU INSTALLATION SEQUENCE

(For Skewed or Sloped/Skewed Applications)

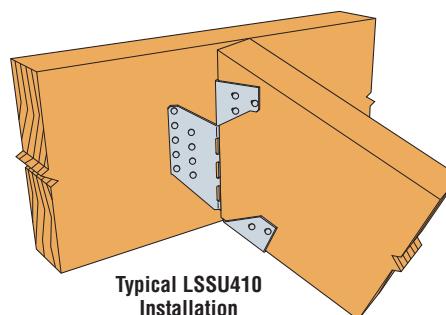

LSSU410
(LSSU210-2,
LSSUH310 similar)

The LSU5.12 must be factory-skewed 0° to 45°. It may be field-sloped to 45°. (LSU4.12, LSU4.28 and LSU3510-2 similar)

Hanger shown skewed right

Typical LSSU410 Installation

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Roof loads are 125% of floor loads unless limited by other criteria.

2. Uplift loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

3. LSU3510-2, LSU4.12, LSU4.28 and LSU5.12 skew option must be factory-ordered.

4. Minimum 11" joist height for LSU3510-2, LSU4.12, LSU5.12; 9 1/2" for all others.

5. For skewed LSSU/LSSUI hangers, the inner most face fasteners on the acute angle side are not installed.

6. Do not substitute 10dx1 1/2" nails for face nails on slope and skew combinations or skewed only LSU, LSSU and LSSUI. See pages 22-23 for other nail sizes and information.

7. **NAILS:** 16d = 0.162" dia. x 3 1/2" long, 10d = 0.148" dia. x 3" long,
10dx1 1/2" = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

VPA Variable Pitch Connector

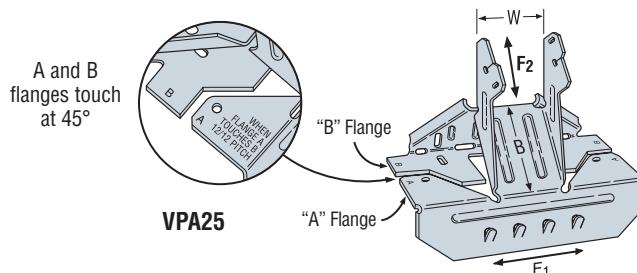

The VPA may be sloped in the field, offering a versatile solution for attaching rafters to the top plate. It will adjust to accommodate slopes between 3:12 and 12:12, making it a complement to the versatile LSSU. This connector eliminates the need for notched rafters, beveled top plates and toe nailing.

MATERIAL: 18 gauge

FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

CODES: See page 12 for Code Reference Key Chart.

1. Uplift loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. Loads may not be increased for short-term loading.

3. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

VPA INSTALLATION SEQUENCE**HCP Hip Corner Plates**

For complementary ridge connection, see page 135

The HCP connects a rafter or joist to double top plates at a 45° angle.

MATERIAL: 18 gauge

FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- Attach HCP to double top plates.
- Birdsmouth not required for table uplift loads but may be required for download.
- Install rafter and complete nailing. Rafter may be sloped to 45°.

CODES: See page 12 for Code Reference Key Chart.

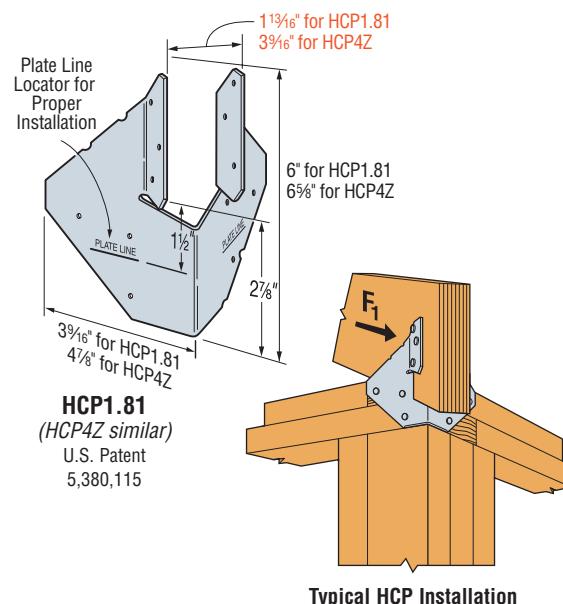

Member Size	Model No.	Fasteners		DF/SP Allowable Loads		SPF/HF Allowable Loads		Code Ref.	
		To Rafter	To Plates	(160)		(160)			
				Uplift	F ₁	Uplift	F ₁		
1¾	HCP1.81	6-10dx1½	6-10dx1½	645	300	555	260	I8, L15, F7	
3½	HCP4Z	8-10d	8-10d	1000	265	860	230		

1. Loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. The HCP can be installed on the inside and the outside of the wall with a flat bottom chord truss and achieve twice the load capacity.

3. **NAILS:** 10dx1½ = 0.148" dia. x 1½" long.

See pages 22-23 for other nail sizes and information.

PAI/MPAI Purlin Anchors

Wood-to-concrete and wood-to-CMU connectors that satisfy code requirements for wind and seismic design categories (SDC) A-F. The PA's dual embedment line allows installation in concrete or CMU wall. The PAI and MPAI are code listed under the 2009 and 2012 IBC and IRC ESR-2920 and have been tested to meet the requirements of ICC-ES acceptance criteria AC-398 for cracked and un-cracked concrete.

MATERIAL: MPAI—14 gauge; PAI—12 gauge

FINISH: Galvanized. Some products available HDG or ZMAX® coating.

INSTALLATION:

- Use all specified fasteners; some models have extra fastener holes. See General Notes.
- Allowable loads are for a horizontal installation into the side of a concrete or CMU wall.

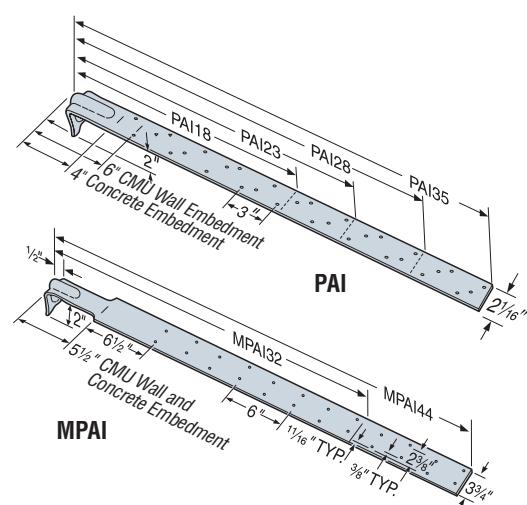

EDGE DISTANCE—Minimum concrete edge distance is 5". Minimum CMU wall left-to-right edge distance is 20".

CONCRETE CMU WALLS—The minimum wall specifications are:

- [A] One #4 vertical rebar, 32" long, 16" each side of anchor;
- [B] Two courses of grout filled block above and below the anchor (*no cold joints allowed*);
- [C] A horizontal bond beam with two #4 rebars, 40" long, a maximum of two courses above or below the anchor.
- [D] Minimum CMU compressive strength, $f'_m = 1500$ psi.

OPTIONS: See LTT and HTT Tension Ties.

CODES: See page 12 for Code Reference Key Chart.

ASCE 7-10 12.11.2.2.5 states:

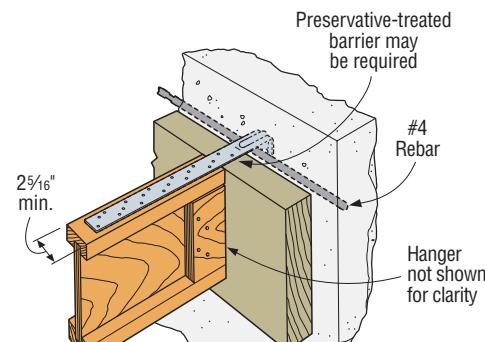

Diaphragm to structural wall anchorage using embedded straps shall be attached to, or hooked around the reinforcing steel, or otherwise terminated to effectively transfer forces to the reinforcing steel.

	MPAI44	44	5 1/2		—	—	—	—	24-10dx1 1/2	2865	—	

1. Allowable loads have been increased for earthquake or wind load durations with no further increases allowed.
2. Deflection at highest allowable loads for standard installation are as follows: PAI18 = 0.10", PAI23 = 0.158", PAI28 = 0.167" and PAI35 = 0.13".
3. Multiply Seismic and Wind ASD load values by 1.4 or 1.6 respectively to obtain LRFD capacities.
4. Minimum center-to-center spacing is 3 times the required embedment for PA/HPA's acting in tension simultaneously, where l_e = embedment depth. Standard installation is based on minimum 5" end distance.
5. For wall anchorage systems in SDC C-F, the maximum allowable strap tensile capacity shall not be less than 1.4 times the ASD anchor design load.
6. Nail quantities are based on Douglas Fir (DF) or equivalent specific gravity of 0.50 or better. For use on Spruce-Pine-Fir (SPF) or Hem Fir (HF) nail quantities must be increased by 1.15 to achieve allowable loads.
7. Structural composite lumber beams have sides that show either the wide face or the lumber strands/veneers. Values in the tables reflect installation in the wide face.
8. Concrete shall have a minimum concrete strength, f'_c of 3000 psi. Minimum $f'_m = 1500$ psi for masonry.
9. 10dx1 1/2 installation directly to framing. For installation over wood structural panel sheathing, use 2 1/2" minimum nail lengths for 1/2" nominal sheathing.
10. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1 1/2 = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

**PAI Purlin to Concrete Wall
(MPAI similar)**

STRONG-DRIVE® SDW TRUSS-PLY & EWP-PLY Screws

The Strong-Drive® SDW Truss-Ply and EWP-Ply screws are a 0.22" diameter, high-strength structural wood screws specifically designed for fastening multi-ply wood members such as plated trusses, engineered-lumber products and solid-sawn lumber. The Strong-Drive SDW Truss-Ply and EWP-Ply screws installs easily with no pre-drilling and is available in optimized lengths for fastening 2, 3 and 4-ply trusses or 1 1/4" engineered lumber such as structural composite lumber (SCL). The Strong-Drive SDW Truss-Ply and EWP-Ply screws enable single-side fastening, while still allowing concurrent loading on both sides of the assembly to the full allowable head or point-side load of the fastener.

- Low-profile head for reduced interference during handling or installation of hardware on the assembly
- High shear values enable wider screw spacing
- Bold thread design firmly cinches plies together to close gaps in multi-ply assemblies
- Optimal screw lengths provide maximum penetration

MATERIAL: Heat-treated carbon steel **FINISH:** Black E-coat™

WARNING: Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Accordingly, the Strong-Drive SDW Truss-Ply and EWP-Ply screws should only be used in dry, interior and non-corrosive environments.

INSTALLATION: • Use all specified fasteners. See General Notes.

- Strong-Drive SDW Truss-Ply and EWP-Ply screws install best with a low-speed 1/2" drill motor and a T-40 6-lobe bit. The matched bit included with the screws is recommended for best results.
- Pre-drilling is typically not required. Strong-Drive SDW Truss-Ply and EWP-Ply screws may be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Section 8.9.2 are met (*pre-drilling required through the plate using a maximum of 5/32" bit*).
- Screw heads that are countersunk flush to the wood surface are acceptable if the screw has not spun out.
- Individual screw locations may be adjusted up to 3" to avoid conflicts with other hardware or to avoid lumber defects.

NOTES TO THE DESIGNER:

1. Single-fastener shear loads and withdrawal loads in this section, are based on testing per ICC-ES AC233. Allowable withdrawal load for DF/SP/SCL is 200 pounds per inch (lbs./in.) and for SPF/HF withdrawal is 150 lbs./in. of thread length penetration into the main member. Total allowable withdrawal load is based on actual thread penetration into the main member.
2. Allowable loads in tables are shown at the load duration factor of $C_d = 1.00$ and shall be multiplied by all applicable adjustment factors per the NDS. Loads may be increased for load duration per the building code up to a C_d of 1.6.
3. Minimum fastener spacing requirements: 6" end distance, 1 1/16" edge distance, 5/8" between staggered rows of fasteners, 4" between non-staggered rows of fasteners and 6" between fasteners in a row. Note exceptions in the application drawing at the top of page 142.
4. Maximum fastener spacing is recommended not to exceed 24" on-center except as approved by a qualified Designer.
5. Structural composite lumber (SCL = LVL, PSL or LSL) loads assume an equivalent Specific Gravity of 0.50 or higher for fastener shear in the wide face (*unless otherwise noted*).
6. Tabular loads in this document are based on the capacity of the Simpson Strong-Tie Strong-Drive SDW Truss-Ply and EWP-Ply screws. The capacity of the multi-ply assembly must be checked by a qualified Designer.
7. For top loaded solid sawn 2x built-up assemblies that are evenly loaded across the entire assembly width, the recommended fastener spacing is two rows at 32" o.c.. For top-loaded SCL 1 1/4" built up assemblies that are evenly loaded across the entire assembly width, the recommended fastener spacing is two rows at 24" o.c. for up to 18" deep members, and 3 rows at 24" o.c. for members deeper than 18".

Strong-Drive® SDW TRUSS-PLY Screw

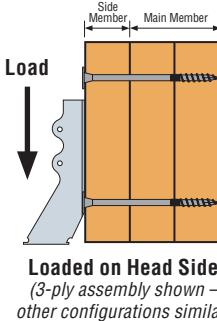

Strong-Drive® SDW EWP-PLY Screw

U.S. Patents 5,897,280;
7,101,133 and 6,109,850

T-40 Driver Bit
(included)
BIT40-R1

1. Typical screw application key:
2x/Truss = Solid-sawn dimensional lumber and plated wood trusses.
2x/Truss Desert = Solid-sawn dimensional lumber and plated wood trusses in desert environments (*scant lumber*).
SCL = 1 1/4" plies of structural-composite lumber.
SCL/3x2PCT = 1 1/4" plies of structural-composite lumber or double 3x2 parallel-chord trusses.
SCL/4x2PCT = 1 1/4" or 3 1/2" plies of structural-composite lumber or double 4x2 parallel-chord trusses.
2. To order mini-bulk buckets add the letters MB to the model number, e.g. SDW22458MB.
3. To order retail pack boxes add "R50" to the model number, e.g. SDW22458-R50.
4. If assembly is less than or equal to 4 1/16" thick, use the SDW22438.
5. If assembly is less than or equal to 6 1/4" thick, use the SDW22600.

STRONG-DRIVE® SDW TRUSS-PLY & EWP-PLY Screws

Table 2 – Strong-Drive® SDW TRUSS-PLY and EWP-PLY Screws Allowable Shear Loads – DF, SP, SPF, HF Lumber and 2x Truss Loaded on Point Side

Assembly	Model No.	Nominal Screw Length (in.)	Thread Length (in.)	Nominal Side Member Thickness (in.)	Main Member Penetration (in.)	DF/SP Allowable Shear	SPF/HF Allowable Shear	Code Ref.

4-ply 2x/Truss	SDW22638	6 ¹ / ₈	1 ¹ / ₁₆	4 ¹ / ₂	1 ³ / ₈ ¹	275	255	

1. For minimum penetration into main member of 1¹/₂", use 235 lbs. for DF/SP and 210 lbs. for SPF/HF.

LUMBER FASTENING IN DRY CLIMATES

The highlighted regions on this map may experience drier conditions which can result in reduced lumber thickness (*scant lumber*) due to wood shrinkage. To help ensure optimum thread penetration into the main (*last*) member without excessive protrusion, Simpson Strong-Tie offers the 4¹/₈" and 6" lengths of the SDW screw, which are sized for the thinner members common in these "desert" climates (see table above). It is the responsibility of the Truss Manufacturer or contractor/installer to determine the appropriate fastener length for any given application. (See tables and footnotes for minimum required penetration.)

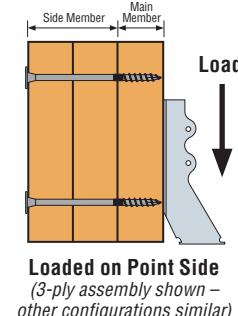

Table 3 – Strong-Drive® SDW TRUSS-PLY and EWP-PLY Screws Allowable Shear Loads – LVL, PSL and LSL Loaded on Head Side

Assembly	Model No.	Nominal Screw Length (in.)	DF/SP Allowable Shear	SPF/HF Allowable Shear	Code Ref.
2-ply 3x2 PCT	SDW22500	5	280	200	
2-ply 4x2 PCT	SDW22634	6½	280	200	170

- To transfer uniform or concentrated loads applied to simply supported spans on assembly top chord:
 - Space screws as required to transfer half the load into the supporting truss.
 - Minimum screw spacing shall be 4" o.c.
- To transfer concentrated loads applied to simply supported spans on an assembly top chord or vertical web:
 - Concentrated loads must be applied at a panel point.
 - Screws to be installed within 12" of the concentrated load on top-chord assembly.
- Gap between the trusses shall not exceed ¼".
- Floor sheathing shall be screwed or nailed to each top-chord ply. (Fastener spacing per the applicable Code requirements, or 12" o.c.)
- Strong-Drive® SDW screws shall not be installed in areas where lumber wane exceeds ¼".
- Hangers on skewed girders:
 - Hanger loads not exceeding 34" o.c. on a skewed girder (resulting from uniformly spaced joists up to 24" o.c.) may be converted to a uniform load.
 - For girders with hanger load spacing in excess of 34" o.c. the loads shall be considered as concentrated loads at the applicable locations.
- Other configurations acceptable as long as approved by Truss Designer.

**Strong-Drive® SDW Screw Position in 2-Ply 4x2 Truss
(2-ply 3x2 similar)**

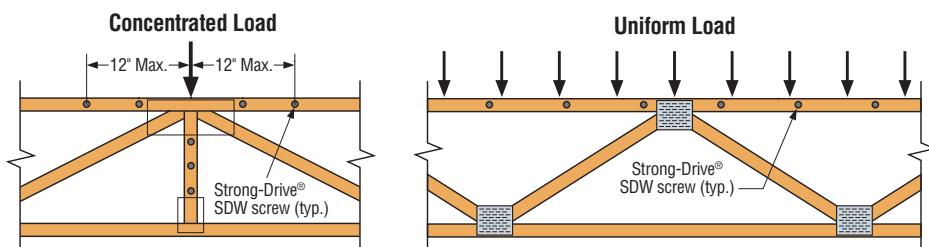

Table 6 – Strong-Drive® SDW TRUSS-PLY and EWP-PLY Screws Allowable Uniform Load Applied to Either Outside Member – Side-Loaded Multi-Ply Assemblies

Multiple Members		Nominal Screw Length (in.)	Loaded Side	DF/SP						SPF/HF					
				12" o.c.		16" o.c.		24" o.c.		12" o.c.		16" o.c.		24" o.c.	
Assembly	Components	2 Rows	3 Rows	2 Rows	3 Rows	2 Rows	3 Rows	2 Rows	3 Rows	2 Rows	3 Rows	2 Rows	3 Rows	2 Rows	3 Rows
A-W	2-ply 2x/Truss	2 1/8	Either	1300	1950	975	1465	650	975	1020	1530	765	1150	510	765
B-W	3-ply 2x/Truss	4 1/8 or 4 1/4	Head	1200	1800	900	1350	600	900	975	1465	730	1095	490	730
		Point		825	1240	620	930	415	620	765	1150	575	860	385	575

		Point		735	1100	550	825	365	550	680	1020	510	765	340	510

- Each ply is assumed to carry same proportion of load.
- Loads may be applied to the head side and point side concurrently provided neither published allowable load is exceeded. (Example: a 3-ply DF assembly with a head side load of 1300 plf and point side load of 900 plf may be fastened together with 3 rows of SDW @ 16" o.c.)
- When hangers are installed on point side, hanger face fasteners must be a minimum of 3" long.
- Tables are based on Main Member Penetration as noted in Tables 1 and 2.
- Hanger load spacing on the multi-ply assembly should not exceed 24" o.c. Exception: On a skewed girder, hanger loads up to 34" o.c. (resulting from joists uniformly spaced up to 24" o.c.) may be converted to a uniform load.

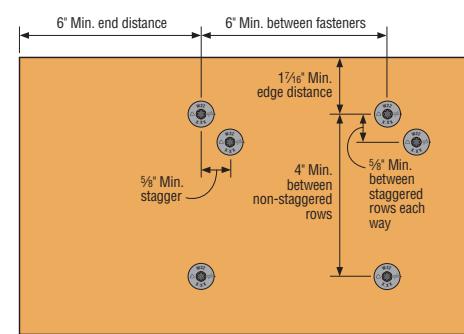

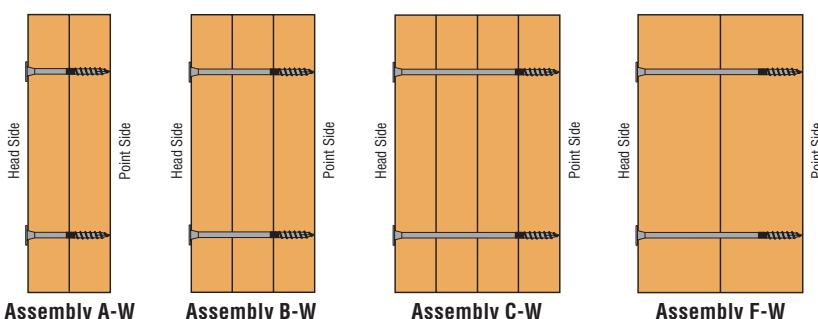

Table 7 – Strong-Drive® SDW TRUSS-PLY and EWP-PLY Screws Allowable Uniform Load Applied to Either Outside Member – Side-Loaded Multi-Ply LVL, PSL and LSL Assemblies

Multiple Members		Nominal Screw Length (in.)	Loaded Side	12" o.c.		16" o.c.		24" o.c.

- Each ply is assumed to carry same proportion of load.
- Loads may be applied to the head side and point side concurrently provided neither published allowable load is exceeded. (Example: a 3-ply assembly with a head side load of 1300 plf and point side load of 1000 plf may be fastened together with 3 rows of SDW @ 16" o.c.)
- When hangers are installed on point side, hanger face fasteners must be a minimum of 3" long.
- Tables are based on Main Member Penetration as noted in single-fastener load tables 3 and 4.

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The THA series have extra long straps that can be field-formed to give height adjustability and top flange hanger convenience. THA hangers can be installed as top flange or face mount hangers.

THA4x and THA2x-2 models feature a dense nail pattern in the straps, which provides more installation options and allows for easy top flange installation.

MATERIAL: See table

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

The following installation methods may be used:

- **Top Flange Installation**—The straps must be field formed over the header – see table for minimum top flange requirements. Install top and face nails according to the table. Top nails shall not be within $\frac{1}{4}$ " from the edge of the top flange members. For the THA29, nails used for joist attachment must be driven at an angle so that they penetrate through the corner of the joist and into the header. For all other top flange installations, straighten the double shear nailing tabs and install the nails straight into the joist.

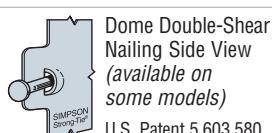

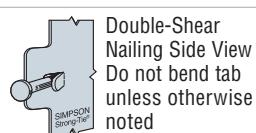

- **Face Mount Installation**—Install all face nails according to the table. Not all nail holes will be filled on all models. On models where there are more nail holes than required, the lowest 4 face holes must be filled. Nails used for the joist attachment must be driven at an angle so that they penetrate through the corner of the joist into the header.

- **Alternate Installation**—The THA 4x hangers may be installed in a top flange configuration using the tabulated fasteners for face mount installation and achieve the face mount installation loads. Install the tabulated face nails into the face and top of the carrying member. Nails used for the joist attachment must be driven at an angle so that they penetrate through the corner of the joist into the header.

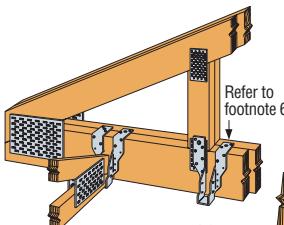

- **Uplift**—Lowest face nails must be filled to achieve uplift loads.

OPTIONS: • THA hangers available with the header flanges turned in for $3\frac{5}{8}$ " (except THA413) and larger, with no load reduction – order THAC hanger.

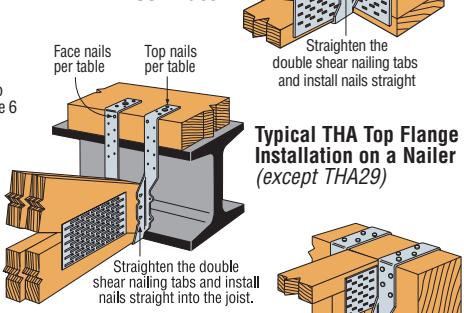

CODES: See page 12 for Code Reference Key Chart.

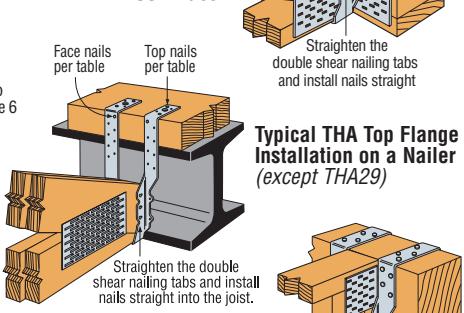

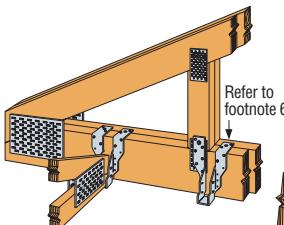

Typical THA29 Face Mount Installation

Typical THA422 Top Flange Installation on a 4x2 Floor Truss

Typical THA Top Flange Installation on a Nailer (except THA29)

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Uplift has been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. Wind (160) is a download rating.
3. For single 4x2 top chord carrying members or single 2x nailers, the following THA hangers can be installed using 10dx1 $\frac{1}{2}$ " nails into the carrying member and tabulated fasteners into the carried member, and use 0.80 of the table value for 18 gauge, and 0.68 of the table value for 16 gauge and 14 gauge.
4. Face mount installation loads are based on minimum of 2-ply 2x

5. Min. Top Flange refers to the minimum length of strap that must be field formed over the header.
6. For the THA 2x models, one strap may be installed vertically according to the face mount nailing requirements and the other strap wrapped over the truss chord according to the top flange nailing requirements (see drawing above) and achieve full tabulated top flange installation loads.
7. **NAILS:** 16d = 0.162" dia. x 3 $\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, 10dx1 $\frac{1}{2}$ " = 0.148" dia. x 1 $\frac{1}{2}$ " long. See pages 22-23 for other nail sizes and information.

THASR/L Adjustable/Skewable Truss Hangers

The THASR/L hangers combine the height adjustability of THA hangers with field skewability, offering maximum flexibility for the installer, and eliminating the need for special orders. Shipped at 22½° right or left, the THASR/L hangers can be field skewed from 22½° to 75° (up to 85° for the THASR/L29 and THASR/L29-2).

The new THASR/L29, 29-2 and 422 are replacing the former 218, 218-2 and 418 versions.

FEATURES: • The THASR/L single and two-ply versions have straps 9" tall.

The 4x version has 22" straps to fit more parallel-chord truss applications.

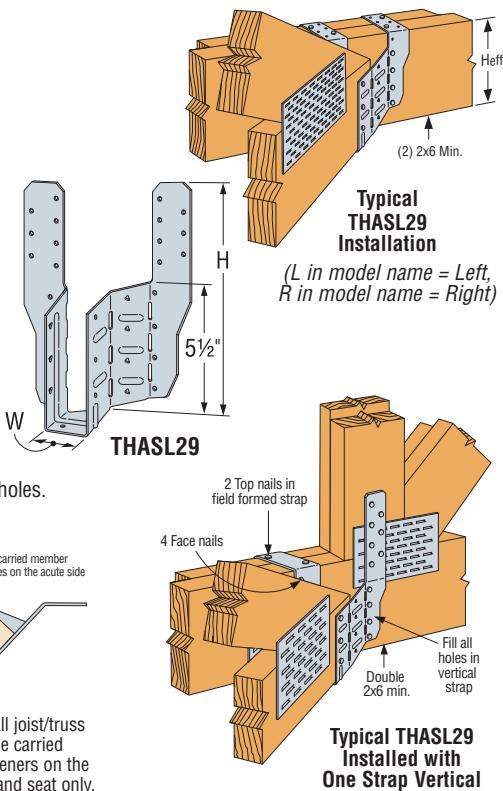

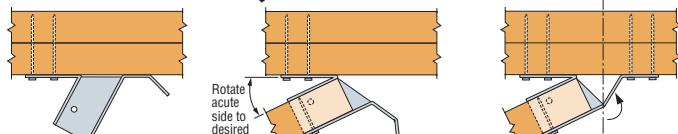

- The new versions have only one acute side bend line to ease design and installation.
- Joist fasteners are only required from one side for skews greater than 22½°.
- Rated for installation with either nails or Simpson Strong-Tie® Strong-Drive® SD Connector screws.

MATERIAL: 16 gauge **FINISH:** Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- Product is factory skewed to 22½° and may be field skewed from 22½° to 75° (up to 85° for the THASR/L29 and THASR/L29-2). See Installation Sequence below for skews greater than 22½°.
- For 22½° skew installations, fill all triangle holes. Triangle holes do not need to be filled for skews greater than 22½°.
- For all installations, fill the fastener hole(s) in the bottom of the hanger seat (THASR/L29 has one and all other models have two).
- For top flange installations, the straps must be field-formed over the header a minimum of 2".
- THASR/L29 and THASR/L29-2—For installations where either strap cannot be field-formed over the header, install the strap(s) vertical and fill all holes. Loads must be reduced as noted in the table footnotes.
- THASR/L422—For face-mount installations, install the carrying member fasteners into the lowest holes.

CODES: See page 12 for Code Reference Key Chart.

**INSTALLATION SEQUENCE FOR SKEWS > 22½°**

Step 1: Install acute side top and/or face header fasteners.

Step 2: Utilizing a piece of scrap fastened to the hanger (on obtuse side only), bend the hanger along the acute side bend line to the desired angle.

Step 3: Bend the obtuse side of the hanger back toward the header until the narrow nailing flange lies flat against the header, and install obtuse side header top and/or face fasteners.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.

2. Wind (160) is a download rating.

3. Minimum carried member heel height shall be 4 1/2".

4. Heft is the distance from the top of the hanger seat to the top of the carried member.

5. For tabulated top flange installation loads, the straps must be wrapped over the header a minimum of 2". Allowable downloads for the THASR/L29 and THASR/L29-2 with one or both straps installed vertically (with all holes filled) are 90% of the tabulated

downloads for skews greater than 22½° and 85% of the tabulated downloads for 22½° skews. Allowable uplift capacities are 100% of the tabulated uplift load capacities.

6. Allowable downloads for 75°-85° skews with one or both straps installed vertically (with all holes filled) shall be limited to 75% of these loads.

7. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1 ½" = 0.148" dia. x 1 ½" long.

See pages 22-23 for other nail sizes and information.

8. **SCREWS:** SD #9x1 ½" (model SD9112) = 0.131" dia. x 1 ½" long, SD #9x2 ½" (model SD9212) = 0.131" dia. x 2 ½" long.

W/WP/WM Plated Truss Top Flange Hangers

The W and WP hangers offer design flexibility and versatility supporting trusses off of wood or steel. WM hangers are designed for use on standard 8" grouted masonry block wall construction.

MATERIAL: W, WM—12 gauge top flange and stirrup,
WP—7 gauge top flange and 12 gauge stirrup

FINISH: Simpson Strong-Tie® gray paint; hot-dip galvanized available; specify HDG.

INSTALLATION: • Use all specified fasteners.

- Hangers may be welded to steel headers with $\frac{1}{8}$ " for W, and $\frac{3}{16}$ " for WP, by $1\frac{1}{2}$ " fillet welds located at each end of the top flange. Weld-on applications produce maximum allowable load listed. Uplift loads do not apply to this application.
- Hangers can support multi-ply carried members; the individual members must be secured together to work as a single unit before installation into the hanger.
- MID-WALL INSTALLATION:** Installed between blocks with duplex nails cast into grout with a minimum of one grouted course above and below the top flange and one #5 vertical rebar minimum 24" long in each adjacent cell.
- TOP OF WALL INSTALLATION:** Install on top of wall to a grouted beam with masonry screws.

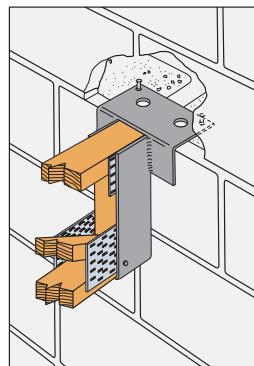

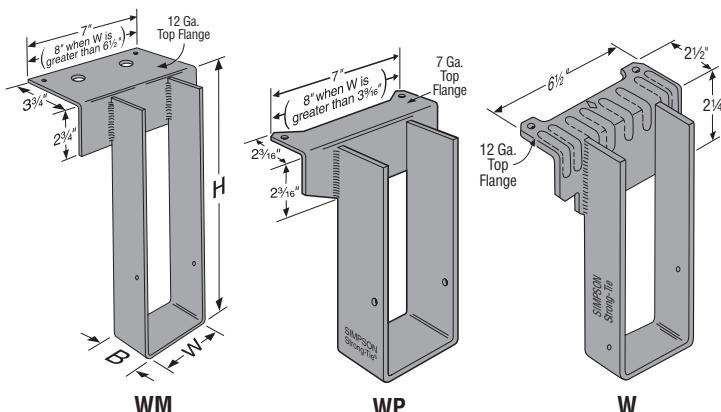

OPTIONS: For 4x2 trusses, specify "alternate nail pattern" (ANP) which relocates the nails to the bottom of the joist. See Hanger Options, pages 233-243 for hanger modifications.

CODES: See page 12 for Code Reference Key Chart.

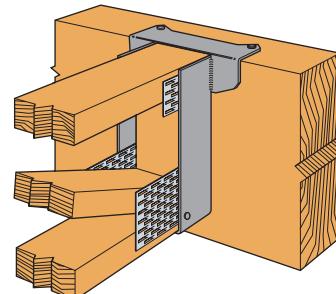

Model	Nailer	Top Flange Nailing	Allowable Loads

1. WM hangers are limited based on joist bearing capacity for the specific wood species, up to the maximum test value of 4175 lbs. All headers are grouted masonry block.

2. Wind (160) is a download rating.

3. "Min. H" is the minimum H dimension that may be ordered and desired H dimension should be specified. For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.

4. **NAILS:** 16d DPLX = 0.162" dia. x 3 1/2" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1 1/8" long. See pages 22-23 for other nail sizes and information.

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

All hangers in this series have double shear nailing – an innovation that distributes the load through two points on each joist nail for greater strength. This allows for fewer nails, faster installation, and the use of all common nails for the same connection.

Double shear hangers range from the light capacity LUS hangers to the highest capacity HGUS hangers. For medium load truss applications, the MUS offers a lower cost alternative and easier installation than the HUS or THA hangers, while providing greater load capacity and bearing than the LUS.

MATERIAL: See tables below and on page 147.

FINISH: Galvanized. Some products available in stainless steel or ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

- Nails must be driven at an angle through the joist or truss into the header to achieve the table loads.
- Not designed for welded or nailer applications.

OPTIONS: • LUS and MUS hangers cannot be modified.

- HUS hangers available with the header flanges turned in for 2-2x (3½") and 4x only, with no load reduction. See HUSC Concealed Flange illustration.
- Concealed flanges are not available for HGUS and HHUS.
- See Hanger Options, page 237, for sloped and/or skewed HHUS models.
- Other sizes available; consult your Simpson Strong-Tie representative.

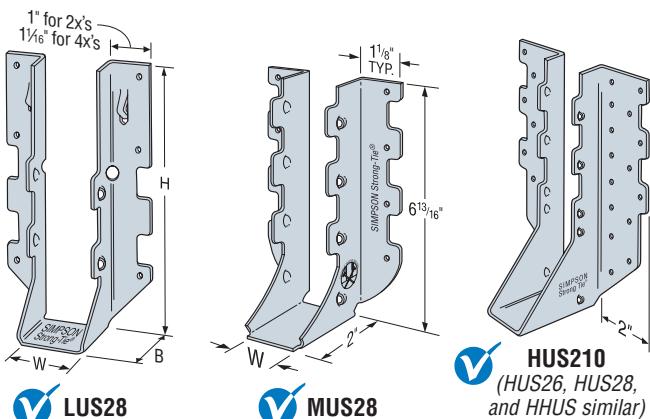

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

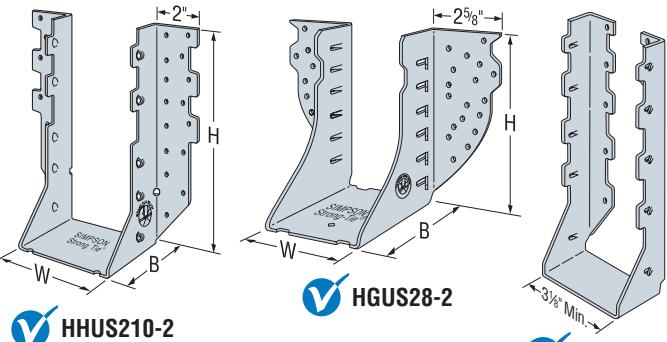

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

1. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™ software or conservatively divide the uplift load by 1.6.
2. Wind (160) is a download rating.
3. Minimum heel height shown is required to achieve full table loads. For less than minimum heel height, see technical bulletin T-REDHEEL.
4. Truss chord cross-grain tension may limit allowable loads in accordance with

- ANSI/TPI 1-2007. Simpson Strong-Tie® Connector Selector™ Software includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
5. Loads shown are based on minimum of 2-ply 2x carrying member. With 3x carrying members, use 16dx2 $\frac{1}{2}$ " nails into the header and 16d commons into the joist with no load reduction. With single 2x carrying members, use 10dx1 $\frac{1}{2}$ " nails into the header and 10d commons into the joist, and reduce the load to 0.64 of the table value.
 6. **NAILS:** 16d = 0.162" dia. x 3 $\frac{1}{2}$ " long. See pages 22-23 for other nail sizes and information.

HTU Face Mount Truss Hangers

The HTU face mount truss hangers have nail patterns designed specifically for shallow heel heights, so that full allowable loads (*with minimum nailing*) apply to heel heights as low as $3\frac{7}{8}$ ". Minimum and maximum nailing options provide solutions for varying heel heights and end conditions.

Alternate allowable loads are provided for gaps between the end of the truss and the carrying member up to $\frac{1}{2}$ " max. to allow for greater construction tolerances (*maximum gap for standard allowable loads is $\frac{1}{8}$ " per ASTM D1761 and D7147*). See technical bulletin T-HANGERGAPS for more information.

MATERIAL: 16 gauge

FINISH: Galvanized

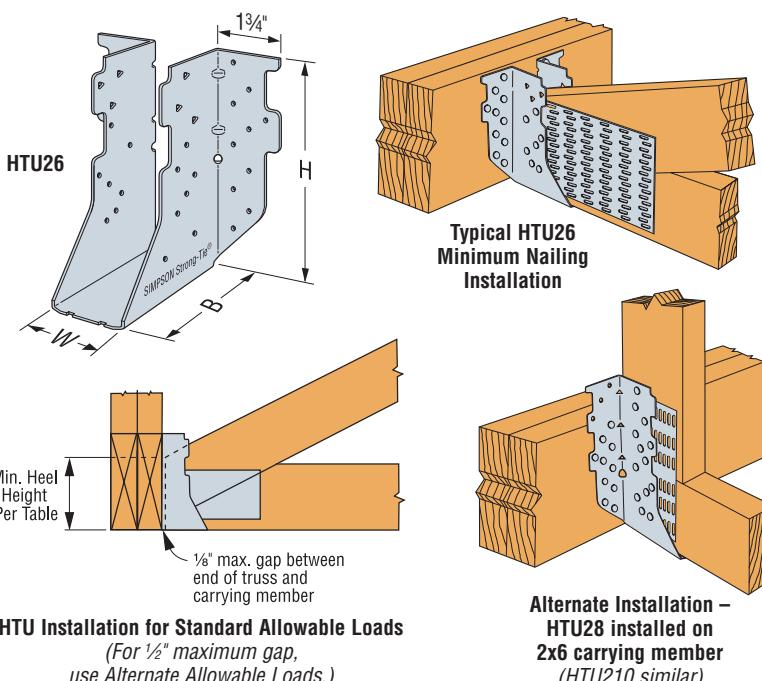

INSTALLATION:

- Use all specified fasteners. See General Notes.
- Can be installed filling round holes only, or filling round and triangle holes for maximum values.
- See alternate installation for applications using the HTU26 on a 2x4 carrying member or HTU28 or HTU210 on a 2x6 carrying member for additional uplift capacity.

OPTIONS: • HTU may be skewed up to $67\frac{1}{2}$.

See Hanger Options on pages 233-243 for allowable loads.

CODES: See page 12 for Code Reference Key Chart.

1. The maximum hanger gap is measured between the joist (or truss) end and the carrying member.
2. Minimum heel heights required for full table loads are based on a minimum 2/12 pitch.
3. Uplift has been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
4. Wind (160) is a download rating.
5. For hanger gaps between $\frac{1}{8}$ " and $\frac{1}{2}$ ", use the Alternate Allowable Loads.
6. Truss chord cross-grain tension may limit allowable loads in accordance with

ANSI/TPI 1-2007. Simpson Strong-Tie® Connector Selector™ Software includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.

7. Loads shown are based on a minimum 2-ply 2x carrying member. For single 2x carrying members, use N10 (10dx1 $\frac{1}{2}$) nails into the header and reduce the allowable download to 0.70 of the table value. The allowable uplift is 100% of the table load.

8. **NAILS:** 16d = 0.162" dia. x 3 $\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, 10dx1 $\frac{1}{2}$ = 0.148" dia. x 1 $\frac{1}{2}$ " long. See pages 22-23 for other nail sizes and information.

See table footnotes on page 148.

HGUQ Multi-Ply Girder Truss Hangers

HGUQ hangers provide similar capacities as HGUS double shear hangers, but they use Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws instead of nails for faster and easier installation. In addition, the Strong-Drive SDS Heavy-Duty Connector screws help transfer the load between the plies of the supporting girder when they penetrate all plies.

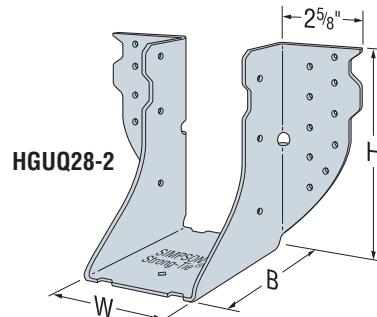

MATERIAL: 12 gauge **FINISH:** Galvanized. **HDG available.** Contact Simpson Strong-Tie.

INSTALLATION: • Use all specified fasteners. See General Notes.

- Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws supplied.
- Not designed for welded or nailer applications.
- The thickness of the supporting girder must be equal to or greater than the screw length. For applications where the length of the supplied screws exceeds the thickness of the supporting girder, 3" or 4 1/2" screws may be substituted for the longer length screws with no load reduction, or a shim block may be used as approved by the Designer.

OPTIONS: These hangers cannot be modified.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Wind (160) is a download rating.
3. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2007. Simpson Strong-Tie® Connector Selector™ Software includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
4. Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Sections 7.5.3.4 and 8.9.2 are met (*pre-drilling required through the plate using a maximum of 5/32" bit*).

5. Strong-Drive SDS Heavy-Duty Connector screws that penetrate all plies of the supporting girder (*screws must penetrate a minimum of 1" into the last truss ply*) may also be used to transfer the load through all the plies of the supporting girder. When Strong-Drive SDS Heavy-Duty Connector screws do not penetrate all plies of the supporting girder truss, supplemental Strong-Drive SDS Heavy-Duty Connector screws at the hanger locations may be required to transfer the load to the truss plies not penetrated by the face fasteners, as determined by the Designer.
6. The supporting girder truss must have adequate thickness to accommodate the screw length, so that the screw does not protrude over the back of the girder. 3" or 4 1/2" long Strong-Drive SDS Heavy-Duty Connector screws may be substituted for the longer Strong-Drive SDS Heavy-Duty Connector screws with no load reduction.
7. For installations to LSL, use the DF/SP table loads.

HHSUQ Heavy Severe Skew Truss Hanger

The HHSUQ is a high-load, face-mount, truss-to-truss hanger designed to accommodate severe skews (45°–84°) for hip trusses, enabling a greater range of installation applications. Fastening the HHSUQ with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws makes installation fast and easy, while eliminating the inconvenience of bolted applications.

MATERIAL: Back plate—3 gauge; stirrup—7 gauge

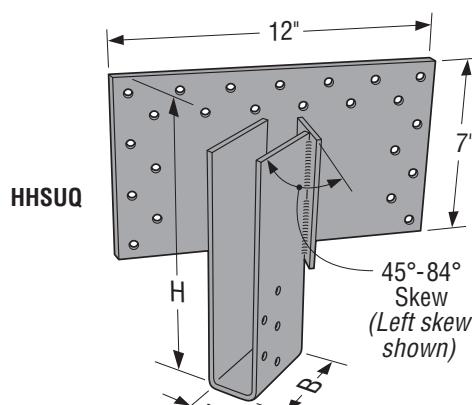

FINISH: Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners. See General Notes.

- The joist/truss end may be square cut or bevel cut.
3½" minimum heel height.
- Strong-Drive SDS Heavy-Duty Connector screws supplied for all round holes.
- All multiple members must be fastened together to act as a single unit.

TO ORDER: Left or right skew must be specified.

CODES: See page 12 for Code Reference Key Chart.

1. Allowable Uplift loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. Strong-Drive® SDS Heavy-Duty Connector screws that penetrate all plies of the supporting girder (*screws must penetrate a minimum of 1" into the last truss ply*) may also be used to transfer the load through all the plies of the supporting girder. When Strong-Drive SDS Heavy-Duty Connector screws do not penetrate all plies of the supporting girder truss, supplemental Strong-Drive SDS Heavy-Duty Connector screws at the hanger locations may be required to transfer the load to the truss plies not penetrated by the face fasteners, as determined by the Designer. 3" long Strong-Drive SDS Heavy-Duty Connector screws into face may be replaced with 4 1/2" or 6" long Strong-Drive SDS Heavy-Duty Connector screws with no load reduction.
3. Loads shown are based on a minimum 2-ply 2x8 carrying member. For single 2x carrying members, replace 3" long Strong-Drive SDS Heavy-Duty Connector screws face fasteners with 1 1/2" long Strong-Drive SDS Heavy-Duty Connector screws and

reduce the allowable download to 2630 lbs. for DF/SP and 1895 lbs. for SPF/HF. The tabulated allowable uplift load is not reduced.

4. Girders must be adequately laterally braced to prevent excessive displacement due to secondary torsional stresses (*Ref ANSI/TPI 1-2007 Section 7.5.3.5*).
5. Truss chord cross-grain tension may limit allowable loads. Designer to refer to ANSI/TPI Section 7.5.3.2 for connection details, limitations, and reductions.
6. Simpson Strong-Tie® Strong-Drive SDS Heavy-Duty Connector screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Sections 7.5.3.4 and 8.9.2 are met (*pre-drilling required through the plate using a maximum of 5/32" bit*).
7. For installations into LSL or PSL, use DF/SP table loads.

THAR/L422 Skewed Truss Hangers

Designed for 4x2 floor trusses and 4x beams, the THAR/L422 has a standard skew of 45°. Straps must be bent for top flange installation. PAN nailing helps eliminate splitting of 4x2 truss bottom chords.

MATERIAL: 16 gauge

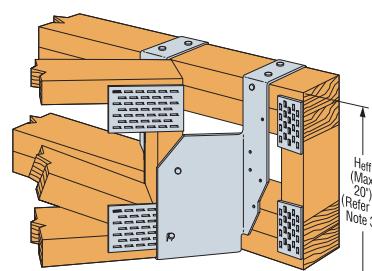

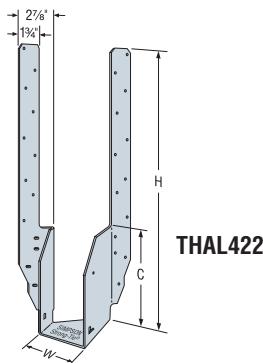

FINISH: Galvanized

INSTALLATION: • Use all specified fasteners.

See General Notes.

- Straps must be field-formed over the header a minimum of 2 1/2".
- Minimum and maximum nailing configurations available – see table for nailing requirements.

CODES: See page 12 for Code Reference Key Chart.

Typical THAL422 Installation
with Minimum Nailing on a Floor Truss
with Double 4x2 Top Chord

Model No.	Ga	Dimensions (in.)			Minimum Top Chord on Carrying Member	Effective Height Heff ³	Fasteners				DF/SP Allowable Loads				SPF/HF Allowable Loads				Code Ref.

1. Uplift has been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. Roof loads are 125% of floor loads unless limited by other criteria.

Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.

3. Where the top of the carried member is flush with the top of the carrying member, Heff is equal to the depth of the carried member. Otherwise, Heff shall be measured from the top of the bearing seat to the top of the carrying member.

4. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1 1/2 = 0.148" dia. x 1 1/2" long.
See pages 22-23 for other nail sizes and information.

LTHMA Multiple Truss Hangers

Light capacity hanger designed to carry 2 or 3 trusses in a terminal hip installation.

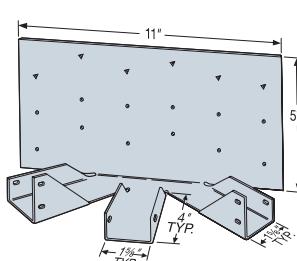

MATERIAL: 16 gauge

FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- The total load must be symmetrically distributed about the centerline to avoid eccentric loading of the connector.
- Fill round holes for girder trusses with 2x4 bottom chords.
- Fill round and triangle holes for girder trusses with 2x6 bottom chords.

CODES: See page 12 for Code Reference Key Chart.

THJU Truss Hip/Jack Hanger

The THJU hip/jack hanger offers the most flexibility and ease of installation without sacrificing performance. The U-shaped hanger works for right and left hand hips and can be ordered to fit a range of hip skews (up to 67½ degrees) as well as various single and 2-ply hip/jack combinations. Also can be installed before or after the hip and jack.

THJU26 is sized for the standard hip/jack combination with a 45-degree left or right-hand hip. The wide seat of THJU26-W accommodates a 2-ply hip and 2-ply jack combination with a 45 degree maximum hip skew, or a standard single-ply hip/jack configuration with a maximum 67½-degree hip skew. Intermediate seat widths are available for other hip/jack or hip/hip combinations.

MATERIAL: 12 gauge

FINISH: Galvanized

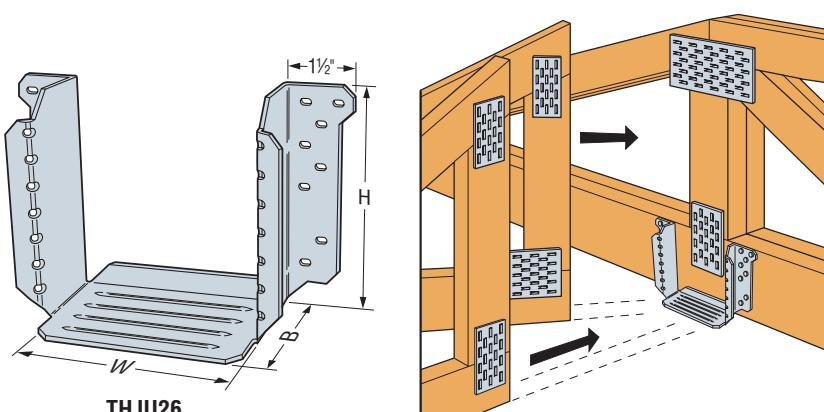

INSTALLATION: • Use all specified fasteners.

See General Notes.

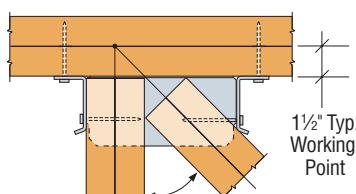

OPTIONS:

- THJU is available in intermediate seat widths between 5½" (THJU26 width) and 8½" (THJU26-W width) with no load reduction.
- For double hip installation, divide the total allowable load by 2 to determine the allowable load for each hip. Order as THJU26X and specify width; see table page 237 for reference.

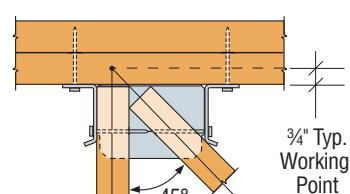

CODES: See page 12 for Code Reference Key Chart.

1. Tabulated loads are the total allowable loads of the hip and jack members combined; 65%-85% of the total load shall be distributed to the hip member, and the remaining percentage of total load shall be distributed to the jack.

The combined hip and jack load may not exceed the published total load.

2. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed.

3. For full load, the jack requires either a min. 2x6 bottom chord or a min. 2x4 end vertical; the hip requires either a min. 2x6 bottom chord or a min. 2x6 end vertical for hip skews up to 60°. For hip skews greater than 60° (THJU26-W only), a min. 2x6 bottom chord or min. 2x8 end vertical is required.

4. With single 2x carrying members use 10dx1½" nails and use 100% of the table value.

5. For single 2x jacks, 10dx1½" nails may be substituted for the specified 10d commons with no reduction in load.

6. Truss chord cross-grain tension may limit allowable loads.

7. **NAILS:** 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

TJC Jack Truss Connector

TJC is a versatile connector for jack trusses. Adjustable from 0 to 85 degree (shipped with 67.5 degree bend). Nail hole locations allow for easy installation. Minimum nailing option on TJC37 provides faster installation and lower installed cost.

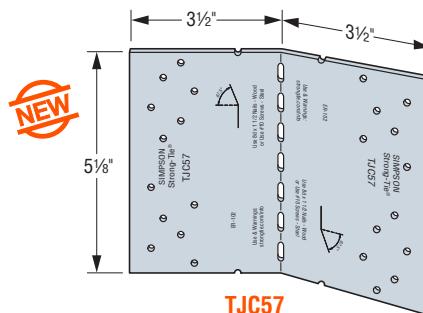

MATERIAL: 16 gauge

FINISH: Galvanized

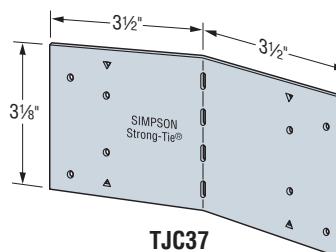

INSTALLATION: • Use all specified fasteners; see General Notes.

- TJC37 can be installed filling round holes only, or filling round and triangle holes for maximum values.
- To reduce the potential for splitting, install the TJC with a minimum $\frac{3}{16}$ " edge distance on the chord members.
- Position the jack truss on the inside of the bend line with the end of the jack truss flush with the bend line.
- Bend the TJC to the desired position (*one bend cycle only*).
- No bevel cut required.
- Attachment of TJC to the top chord requires the Designer to check connection geometry for placement on both carried and carrying chord members. See Top Chord Member Sizes table below for suggested chord sizes.
- Supported jack member is a single 2x.

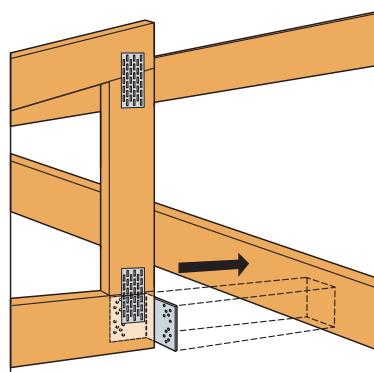

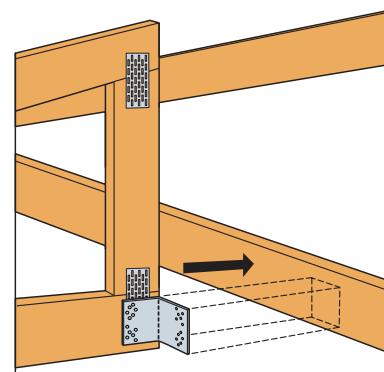

CODES: See page 12 for Code Reference Key Chart.

LTHJA26 Truss Hip/Jack Hangers

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The LTHJA26 is a lighter capacity version of the THJA26 and offers the lowest cost alternative for light hip/jack load applications.

MATERIAL: 18 gauge

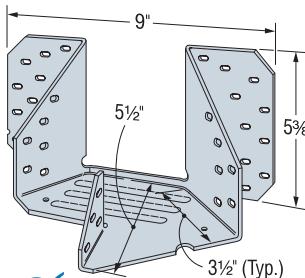

FINISH: Galvanized

INSTALLATION:

- Use all specified fasteners. See General Notes.
- Shall be attached to a double girder truss to allow for required minimum nail penetration. See footnote 3.
- 10dx1½" nails must be installed into bottom of hip members through bottom of hanger seat for table loads.

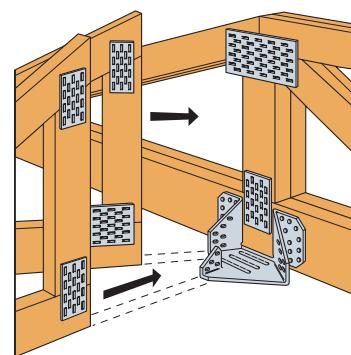

OPTIONS: These hangers can not be modified.

CODES: See page 12 for Code Reference Key Chart.

1. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. Wind (160) is a download rating.
3. Loads shown are based on a minimum 2-2x6 carrying member. For single 2x carrying members (min. 2x6), use 10dx1½" nails and use 0.67 of the table value.
4. Tabulated hip and jack allowable loads assume that 75% of the total load is distributed to the hip and 25% to the jack. It is permitted to distribute 65% to 85% of the tabulated total load to the hip, and the remaining percentage of total load to the jack. The combined hip and jack load may not exceed the published Total Load.
5. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2007. Simpson Strong-Tie® Connector Selector™ Software includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
6. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1½" = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

THJA26 Truss Hip/Jack Hangers

The versatile THJA26 can accommodate right or left hand hips (at 45-degree skews), and can be installed before or after the hip and jack. Can also be used for double (terminal) hips.

MATERIAL: 14 gauge

FINISH: Galvanized

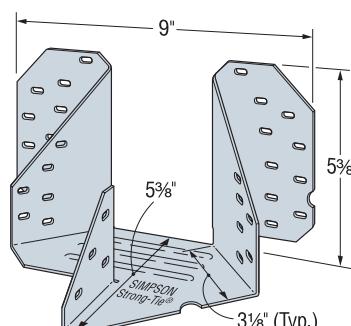

INSTALLATION: • Use all specified fasteners.

See General Notes.

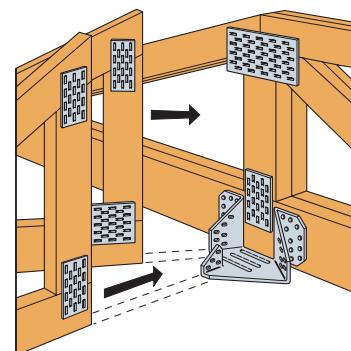

- All multiple members must be fastened together to act as a single unit.
- Shall be attached to a double girder truss to allow for required minimum nail penetration. See footnote 3.

OPTIONS: These hangers cannot be modified.

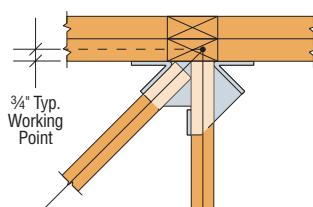

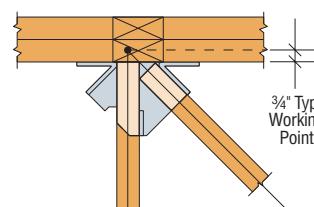

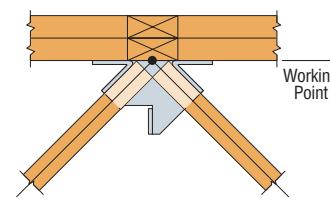

CODES: See page 12 for Code Reference Key Chart.

				Total	960	2680	3080	3265	3265	785	2320	2670	2800	2800	

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. Wind (160) is a download rating.
3. Loads shown are based on a minimum 2-2x6 carrying member. For single 2x carrying members (*min. 2x6*), use 10dx1 1/2" nails and use 0.67 of the table value. For 2-2x4 carrying members, multiply the download by 0.50.
4. 16d sinkers (0.148" dia. x 3 1/4" long) may be substituted for the specified 16d commons at 0.85 of the table load.
5. Tabulated hip and jack allowable loads assume that 75% of the total load is distributed to the hip and 25% to the jack. It is permitted to distribute 65% to 85% of the tabulated total load to the hip, and the remaining percentage of total load to the jack. The combined hip and jack load may not exceed the published Total Load.
6. For terminal hips, divide the total allowable load by 2 to determine the allowable load for each hip.
7. Truss chord cross-grain tension may limit allowable loads in accordance with ANSI/TPI 1-2007. Simpson Strong-Tie® Connector Selector™ Software includes the evaluation of cross-grain tension in its hanger allowable loads. For additional information, contact Simpson Strong-Tie.
8. **NAILS:** 16d = 0.162" dia. x 3 1/2" long, 10dx1 1/2 = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

MTHMQ/MTHMQ-2 Multiple Truss Hangers

The MTHMQ and MTHMQ-2 are redesigned versions of our medium-to-high load capacity hangers for carrying 2 or 3 trusses. The new design offers concealed flanges and installs with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws for easier installation.

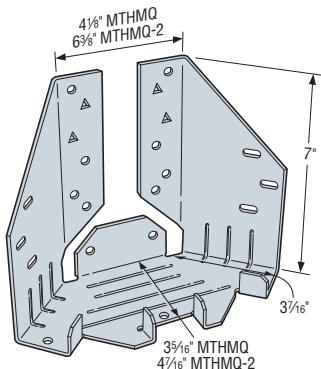

MATERIAL: 12 gauge

FINISH: Galvanized (G90)

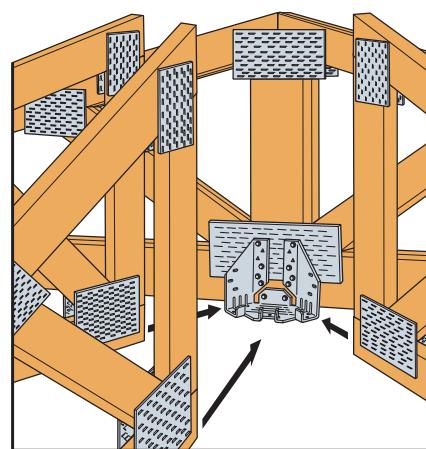

INSTALLATION:

- Use all specified fasteners. See General Notes.
- Can be installed filling round holes only, or filling round and triangle holes for maximum load. For all installations, fill the fastener holes in the bottom of the hanger seat.
- For installations at panel points with 2x6 bottom chords, do not fill the triangle holes unless approved by the Truss Designer.

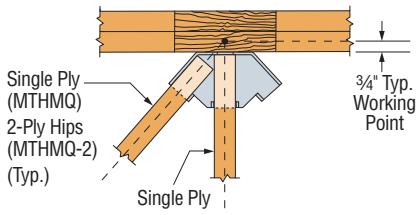

CODES: See page 12 for Code Reference Key Chart.

- Allowable loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- A minimum 2-ply carrying member is required for the tabulated loads. With single 2x carrying members, use 1/4"x1 1/2" Strong-Drive® SDS Heavy-Duty Connector screws into the carrying member and reduce the load to 0.60 of the table value.
- For installations on 2x6 carrying members not at a panel point, the four uppermost face fasteners are not installed. For installations on 2x6 carrying members at a panel point, fasteners are installed into the round holes only (*minimum vertical member sizes are 2x6 and 2x8 for the MTHMQ and MTHMQ-2, respectively*).
- Tabulated two-member allowable loads assume that 75% of the total load is distributed to the hip and 25% to the jack. It is permitted to distribute 65% to 85% of the tabulated total load to the hip, and the remaining percentage of total load to the jack. The combined hip and jack load may not exceed the published Total Load.

- For terminal hips divide the total allowable load by 2 to determine the allowable load for each hip.
- Tabulated three-member loads assume that each hip carries 40% of the total load and the jack carries 20% of the total load. Other hip/jack load distributions are allowed if the sum of all three carried members does not exceed the total load and the hip members are equally loaded.
- The total allowable download for the MTHMQ-2-SDS3 (Min) for a 3-member connection at the 115/125/160 load duration is 5400 lbs. (DF/SP) and 3890 lbs. (SPF/HF).
- Truss chord cross-grain tension may limit allowable loads as determined by the Designer in accordance with ANSI/TPI 1-2007.
- Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Section 7.5.3.4 and 8.9.2 are met (*pre-drilling required through the plate using a maximum of 5/32" bit*).

THJM Multiple Truss Hip Jack Hanger

The THJM is a non-welded hanger designed to carry radial-end jack framing and provide optimal efficiency for those multi-plane, angled bay roofs over breakfast, study and library alcoves. The unique patent pending design of the THJM accommodates 2x4 girder bottom chords and uses our Strong-Drive® SDS Heavy-Duty Connector screws for easy installation with minimal fasteners.

FEATURES:

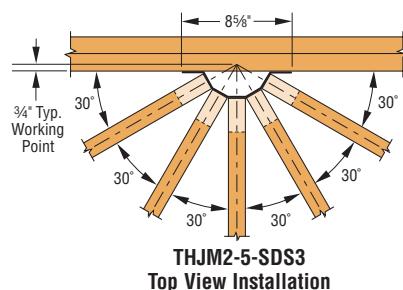

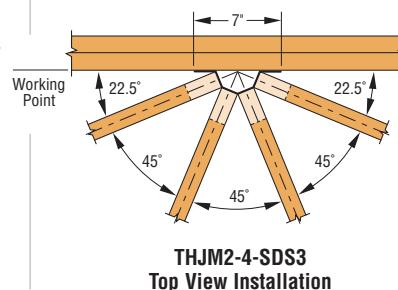

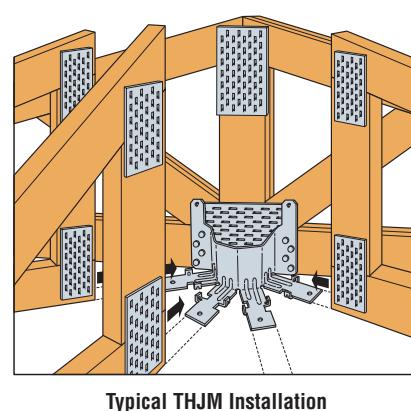

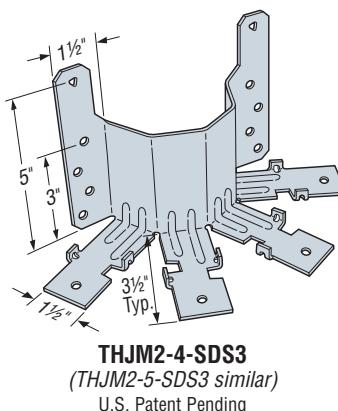

- The THJM hangers are designed for installation with $\frac{1}{4}$ "x3" Strong-Drive® SDS Heavy-Duty Connector screws that are included with the parts.
- The THJM2-4-SDS3 is designed for four incoming jack trusses with the outer jacks being $22\frac{1}{2}^\circ$ from the face of the girder and the inner jacks being 45° from each other and the outer jacks.
- The THJM2-5-SDS3 is designed for five jacks coming into the hanger at 30° from the girder and each other.
- Tabs on the seats of the THJM assist in the placement of the jacks and also include obround holes for optional slant nails ($10dx1\frac{1}{2}''$) when increased uplift is required.

MATERIAL: 12 gauge **FINISH:** Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- Each carried jack truss requires one $\frac{1}{4}$ "x3" Strong-Drive SDS Heavy-Duty Connector screw installed into the bottom chord through the bottom of the hanger seat.
- For installation on girders with 2x6 or 2x8 bottom chords, install one additional $\frac{1}{4}$ "x3" Strong-Drive SDS Heavy-Duty Connector screw in the triangular hole on each vertical strap.
- Install two (2) $10dx1\frac{1}{2}''$ slant nails in the obround holes on each of the seat tabs to achieve the additional uplift load noted in the footnote.

CODES: See page 12 for Code Reference Key Chart.

1. Tabulated loads are the total allowable loads of all carried members combined; the load on any single carried member shall not exceed 25% of the total published load for the THJM2-4 or 20% of the total published load for the THJM2-5.
2. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
3. A minimum 2-ply carrying member is required for the $\frac{1}{4}$ "x3" Strong-Drive® SDS Heavy-Duty Connector screws (*provided*). For single 2x carrying members, use $\frac{1}{4}$ "x1 1/2" Strong-Drive SDS screws (*not supplied*) with corresponding loads.

4. A minimum 2-ply carrying member is required for the tabulated loads.
5. Truss chord cross-grain tension may limit allowable loads per ANSI/TPI 1-2007. The optional triangle holes may be used for installation on 2x6 and larger carrying members, for a total of 10 fasteners into the carrying member, to resist cross-grain tension forces when no other mechanical reinforcement is available.
6. Tabs on the seats of the THJM hangers have obround holes for optional $10dx1\frac{1}{2}''$ slant nails (2 per carried member) when additional uplift capacity is required. Total allowable uplift with the optional $10dx1\frac{1}{2}''$ slant nailing is 970 lbs. (DF/SP/SPF/HF).

DSC Drag Strut Connector

The DSC drag-strut connector transfers the diaphragm shear forces from the girder truss or beam to the shearwalls. The new DSC5 has been designed to optimize fastener location, resulting in a connector that outperforms the DSC4 with fewer fasteners. The DSC2 is a smaller, lighter version that installs with fewer screws.

FEATURES:

- The DSC5 requires 40% fewer fasteners than our previous DSC4, and gets 12% higher loads
- Left hand and right hand versions available
- DSCs install with the $\frac{1}{4}$ "x3" Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws provided

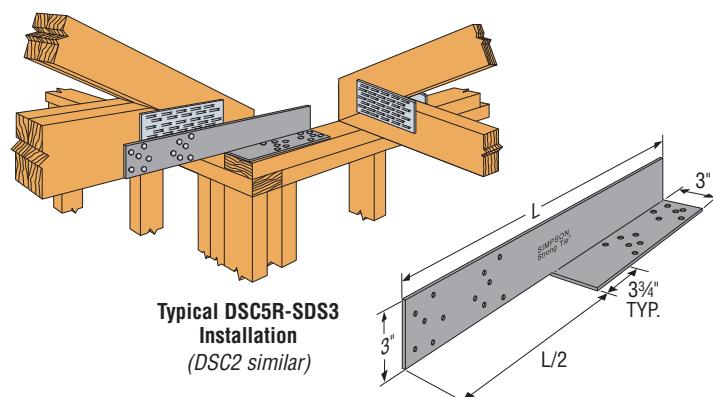

MATERIAL: DSC2—7 gauge, DSC5—3 gauge

FINISH: DSC2—Galvanized; DSC5—Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners; see General Notes.

- Strong-Drive SDS Heavy-Duty Connector screws are provided.

CODES: See page 12 for Code Reference Key Chart.

Model No.	L (in.)	Fasteners	DF/SP Allowable Loads		SPF/HF Allowable Loads		Code Ref.
			Compression (160)	Tension (160)	Compression (160)	Tension (160)	
DSC2R/L-SDS3	16	20- $\frac{1}{4}$ "x3" SDS	2590	3720	1865	2680	F12
DSC5R/L-SDS3	21	24- $\frac{1}{4}$ "x3" SDS	4745	5925	3415	4265	

1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws minimum penetration is $2\frac{1}{4}''$, minimum end distance is $2\frac{1}{2}''$ for DSC2 and $3\frac{1}{4}''$ for DSC5.

3. $3\frac{1}{4}''$ for DSC5 and minimum edge distance is $\frac{5}{8}''$ for full load values.

3. Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Section 7.5.3.4 are met (pre-drilling required through the plate using a maximum of $\frac{5}{32}''$ bit).

THGQ/THGQH/HTHGQ SCL-to-Truss Girder Hangers

*This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.*

A lower cost alternative to bolted hangers, the THGQ and THGQH hangers for multi-ply girder trusses use Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws to provide high load capacities and easier installation compared to bolts. The Strong-Drive® SDS Heavy-Duty Connector screws help transfer the load between the plies of the supporting girder when they penetrate all plies.

THGQ and THGQH models offer minimum and optional maximum fastener quantities to accommodate varying design needs. Allowable loads for various girder web member sizes provide additional installation options.

The HTHGQ is a high-load version designed to carry multi-ply trusses or composite lumber up to 5-ply girder trusses. For high-load capacities and easier installation compared to bolts, the HTHGQ is designed for use with Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws.

MATERIAL: THGQ—7 gauge, THGQH/HTHGQ—3 gauge

FINISH: THGQ—Galvanized, THGQH/HTHGQ—Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners. See General Notes.

- Can be installed filling round holes only, or filling round and triangle holes for maximum values.
- Strong-Drive SDS Heavy-Duty Connector screws supplied for all round and triangle holes. Installation may not require use of all Strong-Drive SDS Heavy-Duty Connector screws.
- All multiple members must be fastened together to act as a single unit.
- The thickness of the supporting girder must be equal to or greater than the screw length. For applications where the length of the supplied screws exceeds the thickness of the supporting girder, 3" or 4½" screws may be substituted for the longer length screws with no load reduction, or a shim block may be used as approved by the Designer.
- Girders must be adequately laterally braced to prevent excessive displacement due to secondary torsional stresses (Ref ANSI/TP1 1-2007 Section 7.5.3.5).

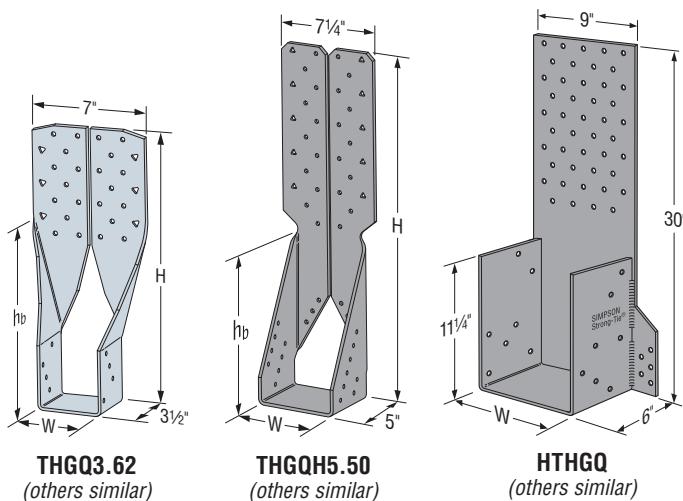

OPTIONS: THGQH hangers for multi-ply truss girders may be skewed 45 degrees. THGQH for structural composite lumber (SCL) cannot be skewed. See Hanger Options on pages 233-243.

CODES: See page 12 for Code Reference Key Chart.

- Allowable uplift loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- Connector must be installed centered on girder vertical webs.
- Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Section 7.5.3.4 and 8.9.2 are met (*pre-drilling required through the plate using a maximum of 5/32" bit*).
- Strong-Drive SDS Heavy-Duty Connector screws that penetrate all plies of the supporting girder (*screws must penetrate a minimum of 1" into the last truss ply*) may also be used to transfer the load through all the plies of

the supporting girder. When Strong-Drive SDS Heavy-Duty Connector screws do not penetrate all plies of the supporting girder truss, supplemental Strong-Drive SDS Heavy-Duty Connector screws at the hanger locations may be required to transfer the load to the truss plies not penetrated by the face fasteners, as determined by the Designer.

- The supporting girder truss must have adequate thickness to accommodate the screw length, so that the screw does not protrude out the back of the girder. 3" or 4½" long Strong-Drive SDS Heavy-Duty Connector screws may be substituted for the longer Strong-Drive SDS screws with no load reduction.
- For installations to LSL, use ¼" x 3" Strong-Drive SDS Heavy-Duty Connector screws and use the DF/SP table loads.
- Wind (160) is a download rating.

- Tabulated allowable loads must be selected based on duration of load as permitted by the applicable building code.
- The uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce when other load durations govern.
- Wind (160) is a download rating.
- Connector must be installed centered on minimum 2x10 vertical web.
- A minimum 3-ply carrying member is required for the tabulated loads.

- Carrying truss plies must be adequately fastened together as determined by Designer.
- Truss chord cross-grain tension may limit allowable loads as determined by the Designer in accordance with ANSI/TPI 1-2007.
- Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Section 7.5.3.4 and 8.9.2 are met (*pre-drilling required through the plate using a maximum of 5/32" bit*).

THGBV/THGBHV/THGWV SCL-to-Truss Girder Hangers

An extension of the THGB/THGBH/THGW series, these high-capacity hangers are designed for attaching 2-ply, 3-ply or 4-ply sized structural composite lumber (SCL) to a girder truss. The THGBV offers optional installation with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws, while the bolted THGBHV and THGWV offer higher load capacities. Two bucket heights are available for each width to accommodate a range of SCL sizes. Options for skewing or dropping the buckets for conditions where the SCL joist is lower than the girder bottom chord provide additional design flexibility for a variety of SCL-to-truss connections.

MATERIAL: 3 gauge

FINISH: Simpson Strong-Tie® gray paint

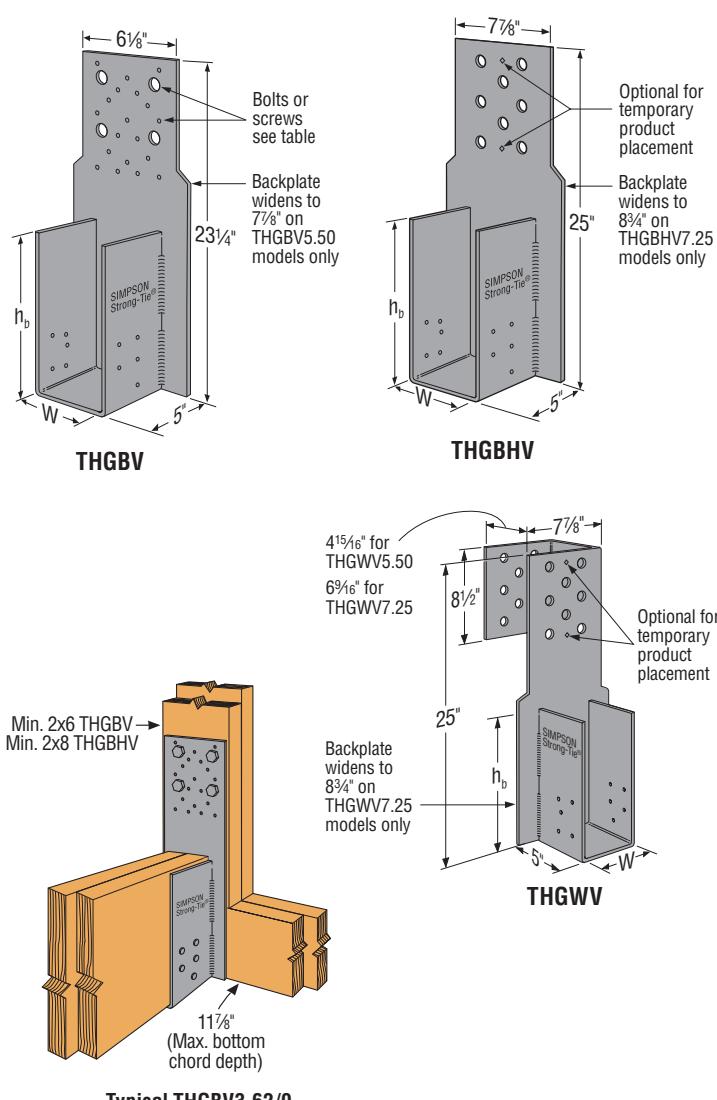

INSTALLATION: • Use all specified fasteners. See General Notes.

- All multiple members must be fastened together to act as a single unit.
- Maximum $11\frac{1}{8}$ " bottom chord in the carrying member to allow for the minimum bolt end distance.
- Bolts must be installed symmetrically when using less than 8 bolts on the 8-bolt backplate.
- Girders must be adequately laterally braced to prevent excessive displacement due to secondary torsional stresses (Ref. ANSI/TPI 1-2007 Section 7.5.3.5).
- Shall be attached to a 2-ply girder truss to allow for required minimum screw penetration. See footnote 4.

OPTIONS: • THGB/THGBH/THGBV/THGBHV hangers can be skewed to a maximum of 45°. Allowable download or uplift is 0.87 of table load. See Hanger Options pages 233-243 for additional options.

CODES: See page 12 for Code Reference Key Chart.

**QUIK DRIVE® AUTO-FEED SYSTEM FOR 2-PLY AND 3-PLY GIRDERS**

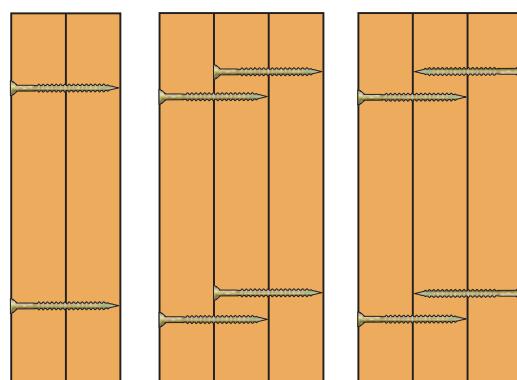

Simpson Strong-Tie® Strong-Drive® WSNTL Wood screws are a safe, fast and reliable method for attaching multi-ply trusses. The WSNTL screws, like their Strong-Drive® SDW Truss-Ply and EWP-Ply screws counterpart, virtually eliminate ply separation during handling.

See the *Fastening Systems* catalog (form C-F-14) for more information.

- Allowable loads are based on a SCL (LVL, PSL or LSL) carried member with an allowable $F_c \perp$ of 750 psi and equivalent Specific Gravity of 0.50 or higher.
- Uplift loads have been increased for earthquake or wind loading with no further increase allowed. Reduce where other loads govern.
- A 3-ply carrying member is required for the THGWV5.50/9 and THGWV5.50/11; a 4-ply carrying member is required for the THGWV7.25/9 and THGWV7.25/11.
- Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws require a minimum 2-ply (3") carrying member.
- Bolts and Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws are permitted to be installed through metal truss connector plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Sections 7.5.3.4 and 8.9.2 are met.
- Wind (160) is a download rating.
- To achieve published loads, machine bolts (MB) into the girder truss shall be installed with the nut on the opposite side of the hanger with a standard cut washer (*except THGWVs*). **Standard cut washers are required for THGBV and THGBHV.**
- NAILS:** 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

THGB/THGBH/THGW Truss Girder Hangers

High capacity, welded hangers for multi-ply girder trusses. The THGB series offers optional installation with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws, and the bolted THGBH and THGW hangers offer higher design loads. For a lower cost alternative that uses Strong-Drive SDS Heavy-Duty Connector screws instead of bolts and offers high load capacities, see the THGQ/THGQH series.

MATERIAL: 3 gauge

FINISH: Simpson Strong-Tie® gray paint

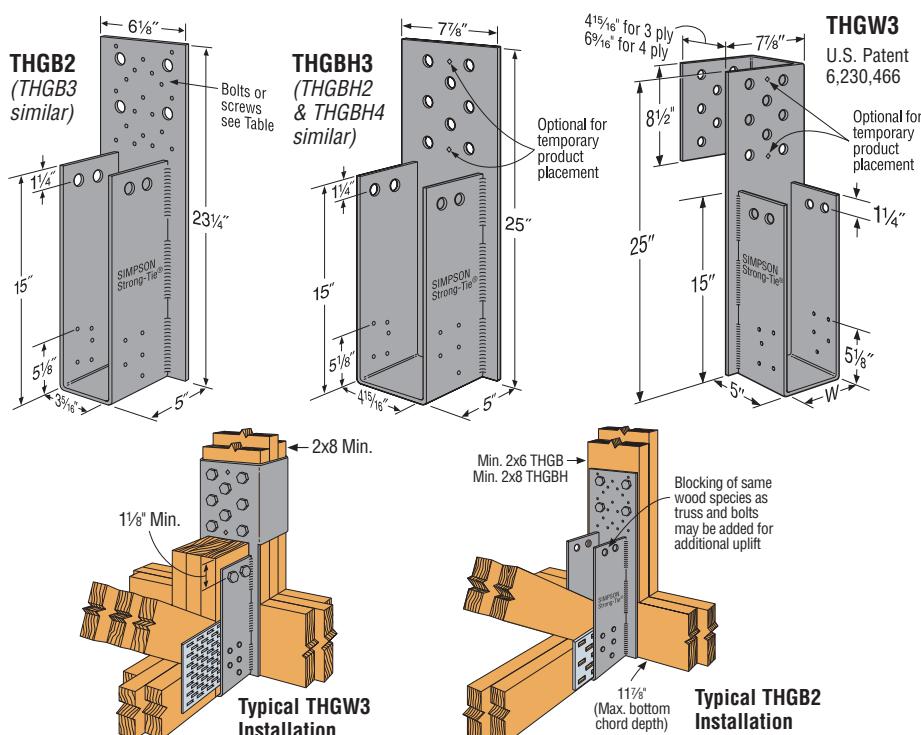

INSTALLATION: • Use all specified fasteners.

See General Notes.

- All multiple members must be fastened together to act as a single unit.
- Maximum 11 7/8" bottom chord in the carrying member to allow for the minimum bolt end distance.
- Bolts must be installed symmetrically when using less than 8 bolts on the 8-bolt backplate.
- Girders must be adequately laterally braced to prevent excessive displacement due to secondary torsional stresses (Ref ANSI/TPI 1-2007 Section 7.5.3.5).

OPTIONS: • See Hanger Options, page 238 for THGB/THGBH skew options.

CODES: See page 12 for Code Reference Key Chart.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. A 3-ply carrying member is required for the THGW3-3 and THGW4-3; a 4-ply carrying member is required for the THGW3-4 and THGW4-4. For all other models, a minimum 2-ply carrying member is required.
3. Simpson Strong-Tie® Strong Drive® SDS Heavy-Duty Connector screws require a minimum 2-ply (3") carrying member.
4. Bolts and Simpson Strong-Tie Strong Drive screws are permitted to be installed through metal truss connector plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Sections 7.5.3.4 and 8.9.2 are met.

5. 10-10d nails for the carried member will achieve the maximum down loads. Uplift loads are 2570 lbs. for DF/SP and 2210 lbs. for SPF/HF. To achieve maximum uplift, install nails and bolts listed in the table.
6. Loads for THGW models require that the supported member have minimum 2x6 end verticals to ensure end-grain bearing. Contact Simpson Strong-Tie for loads when horizontal members are bearing in the hanger seat.
7. Wind (160) is a download rating.
8. To achieve published loads, machine bolts (MB) into the girder truss shall be installed with the nut on the opposite side of the hanger with a standard cut washer (*except THGWs*). Standard cut washers are required for THGB and THGBH.
9. **NAILS:** 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

HTHMQ Heavy Multiple Truss Hangers

The HTHMQ is a versatile, high-capacity truss hanger designed for various lumber types and multiple-ply trusses. The truss hanger accommodates a greater range of structural designs while accommodating right or left hand hips (30° - 60° skews), which can be used for terminal hips with or without the center common jack. The HTHMQ can accommodate various widths of lumber.

FEATURES:

- Available in various stirrup widths to accommodate various lumber types and multiple ply trusses
- Installed with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws that eliminate the inconvenience of bolted installation
- Enables 2-3 member connection for a broader range of structural designs

MATERIAL: Back plate—3 gauge; stirrup—7 gauge

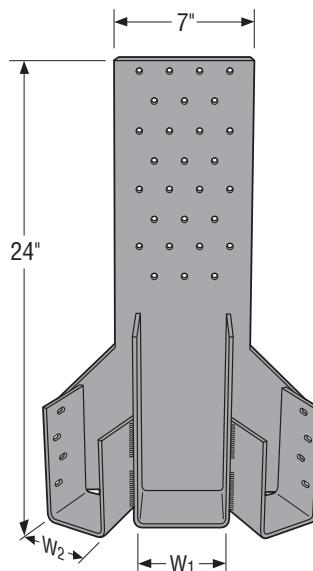

FINISH: Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners.

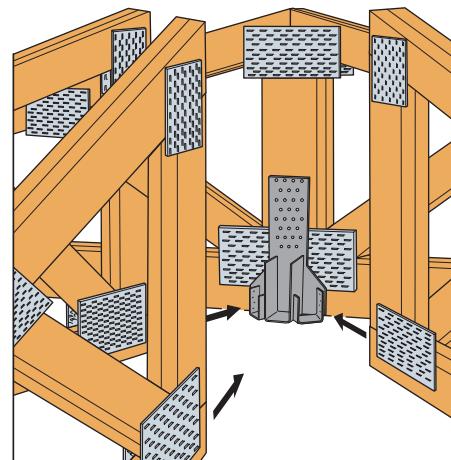

See General Notes.

- Strong-Drive SDS Heavy-Duty Connector screws supplied with connector.
- All multiple members must be fastened together to act as a single unit.
- Shall be attached to a **minimum** double girder truss to allow for required minimum screw penetration. See footnote 5.
- Girders must be adequately laterally braced to prevent excessive displacement due to secondary torsional stresses (Ref ANSI/TPI 1-2007 Section 7.5.3.5).
- See below for different installation options.

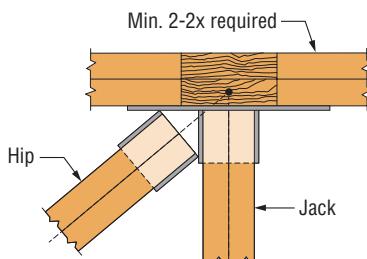

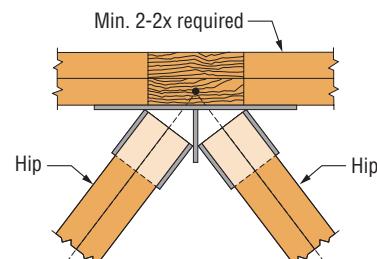

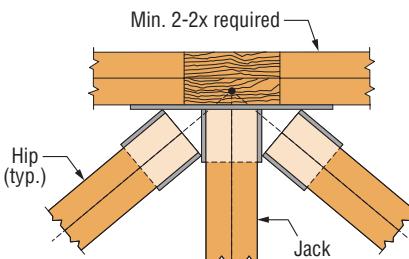

CODES: See page 12 for Code Reference Key Chart.

- Tabulated allowable loads must be selected based on duration of load as permitted by the applicable building code.
- The uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce when other load durations govern.
- Specify W_1 where applicable and Hip Skew Angle.
- Connector must be installed centered on minimum 2x8 vertical web.
- A minimum 2-ply carrying member is required for the tabulated loads.
- Carrying truss plies must be adequately fastened together as determined by Designer.
- Truss chord cross-grain tension may limit allowable loads as determined by the Designer in accordance with ANSI/TPI 1-2007.

8. Tabulated allowable loads for three-member configurations assume that each hip carries 40% of the total load and the jack carries 20% of the total load. Tabulated allowable loads for single hip-jack configurations assume that 75% of the total load is distributed to the hip and 25% to the jack.
9. Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Section 7.5.3.4 and 8.9.2 are met (*pre-drilling required through the plate using a maximum of $\frac{1}{2}$ " bit*).
10. **1 1/4" x 2 1/2" Strong-Drive SDS Heavy-Duty Connector screw may be substituted for the 1 1/4" x 3" Strong-Drive SDS Heavy-Duty Connector screw provided with the HTHMQ with no load reduction. Back-to-back installations require a 3-ply minimum girder.**

ALTERNATE INSTALLATIONS

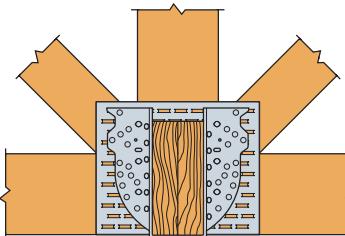

- Block(s) should be of similar size/grade as the truss member to which it is attached. Blocking should be designed to act as one unit with the truss members.
- Block(s) should be of sufficient size to accept all carried/carrying member nails, and develop full seat bearing as specified in Simpson Strong-Tie publications.

- Truss Designer is to confirm blocking size/grade, fasteners required and application.
- Fasteners used to attach the additional blocking should be independent of the truss hanger fasteners.

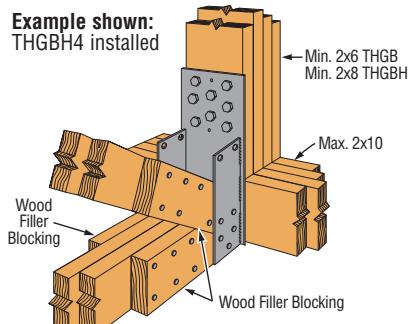

1 Use of Wood Blocking to Achieve the Full Design Load Value of a Face Mount Hanger Attached to a Single Ply Carrying (Girder) Member. (*Block designed by Engineer of Record or Truss Designer*)

Example shown: HGUS210-2 installed on a 2x6 bottom chord
(other applications similar)

2 Connection Design to Achieve Specified Nailing of a Face Mount Hanger at a Panel Point.

Nails located in joints formed by the intersection of wood members or with edge or end distances less than suggested by NDS have no load resistance. The hanger allowable load value shall be reduced by the nail shear value for each header nail less than the specified quantity. Connection shall be approved by the Truss Designer.

3 Use of Wood Filler Blocking for Carried Member Width Less than Hanger Width. (*Block designed by Designer or Truss Designer*)

MSCPT Multiple Truss Hangers

The MSCPT is a high capacity, top flange welded hanger designed to carry 2 or 3 trusses in a terminal hip installation. The top flange is notched at the center to accommodate vertical and diagonal web members in the girder truss.

MATERIAL: Top flange—3 gauge; stirrup—11 gauge (MSCPT2, MSCPT2N), 7 gauge (MSCPT2-2, MSCPT2-2N)

FINISH: Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners. See General Notes.

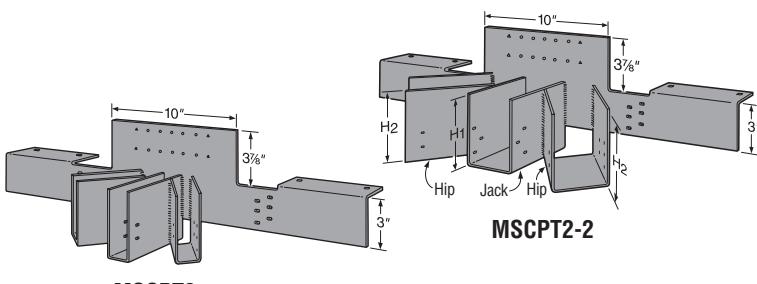

- The total load must be evenly distributed about the centerline to avoid eccentric loading.
- All multiple members must be fastened together to act as a single unit.
- Minimum vertical carrying member sizes are 2x6 for MSCPT2 and MSCPT2N, and 2x8 for MSCPT2-2 and MSCPT2-2N.
- Minimum carrying member bottom chord is a 2-ply 2x6.

OPTIONS: • H_1 and H_2 should be equal to the bottom chord depth of the carrying member in order to maintain all members flush at the bottom.

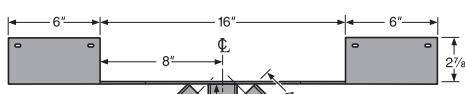

• Hip stirrups can be skewed from 25° to 45°.

• The W_1 and W_2 of the MSCPT2 may be increased up to $3\frac{1}{8}$ ", provided the stirrups' configuration remains symmetrical.

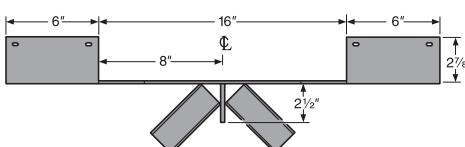

CODES: See page 12 for Code Reference Key Chart.

- For MSCPT2 and MSCPT2-2 models, allowable hip loads are 0.40 x Total Loads, and Jack Loads are 0.20 x Total Loads.
- Uplift loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- Wind (160) is a download rating.
- NAILS:** 16d = 0.162" dia. x 3 1/8" long, 10d = 0.148" dia. x 3" long, 10dx1 1/2" = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

AHEP Adjustable Hip-End Purlin

For wood and cold-formed steel trusses, the Simpson Strong-Tie® AHEP is a structural purlin that also serves as an installation lateral restraint and spacer during the truss erection process. The AHEP attaches to the leading edge of step-down hip trusses, eliminating the need for drop-top chords, 2x lumber or gable end fillers. The interlocking design of the AHEP allows them to install linearly, aligned with the end jacks, to maintain framing spacing from eave to hip or peak. Roof sheathing/decking attaches directly to the purlin with knurled pneumatic fasteners or low-profile head, self-drilling screws. Adjustable in length, the AHEP is designed to accommodate a pitch range of 3/12 to 9/12 as a structural purlin and up to 12/12 as an installation lateral restraint and spacer.

FEATURES:

- A structural purlin to which sheathing can be directly attached – no need to remove temporary bracing
- Accurately spaces the installed trusses and helps meet the temporary top-chord lateral restraint recommendations of WTCA/TPI BCSI on step-down hip ends
- Adjustable in length to accommodate a wide pitch range

MATERIAL: 20 gauge (33 mil) **FINISH:** Galvanized

INSTALLATION:

- Use all specified fasteners; see General Notes.

- Prior to installation, the AHEP must be set to the proper length and the two tubes fastened together with four #10x $\frac{3}{4}$ " self-drilling screws through the round holes in the side flanges for pitches between 3/12 and 9/12; and in the triangular and upper round hole when the AHEP will be used as an installation restraint and spacer at pitches 9/12 up to 12/12.
- For trusses spaced 24" o.c., the pitch markings on the inner tube may be used to line up the tubes to the correct length for a given pitch. For other spacings, the length of the AHEP must be set to the calculated sloping length (*from leading edge to leading edge of the framing members*).
- To install the AHEPs on wood trusses, use four 10d (.148"x3") nails. The two nails at the bottom of the part (*the yoke end*) must be clinched.
- Sheathing is attached to the AHEP with knurled pneumatic fasteners or low-profile-head, self-drilling screws.
- For efficiency, the AHEPs should be installed in line with the end jacks so that framing alignment can be maintained from eave to hip/ridge.

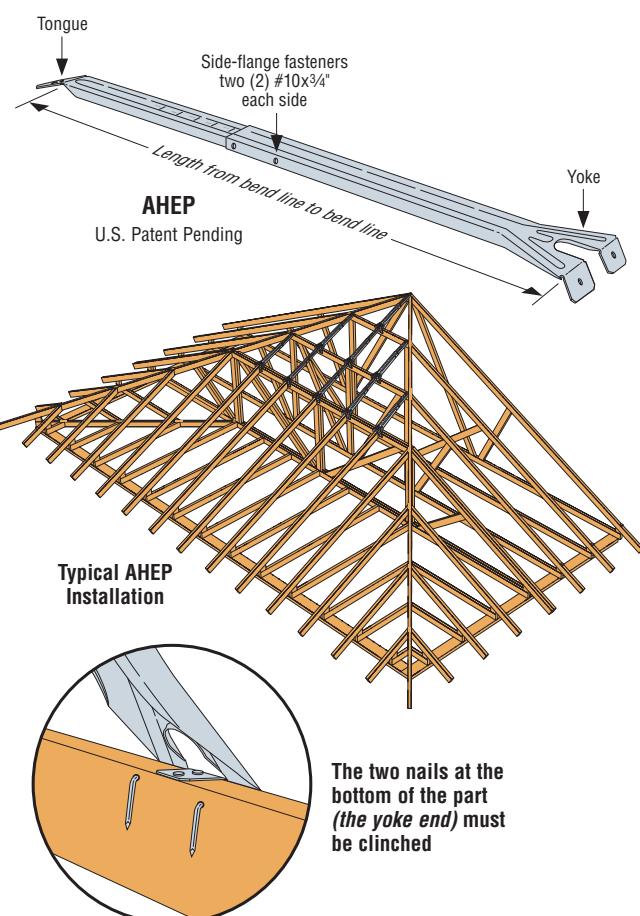

CODES: See page 12 for Code Reference Key Chart.

Online Calculator for AHEP Installation

A Web-based calculator is available to help Designers check AHEP applicability based on the actual hip-end roof pitch, input live and dead loads, truss and purlin spacing and the selected sheathing and deflection criteria. To view the calculator, visit www.strongtie.com/webapps/ahep.

Model No.	Fasteners		Sheathing Option	Allowable Down Loads						Code Ref.		
				3/12 Pitch		3.1/12 Pitch		9/12 Pitch				
	AHEP Side Flanges	To Hip Trusses		L/180	$\frac{3}{16}$ "	L/180	$\frac{3}{16}$ "	L/180	$\frac{3}{16}$ "			
AHEP	4 - #10	4 - 10d	None	180	240	180	240	135	150	I13, F12		
			$\frac{15}{32}$ " (Min.) Wood Sheathing	250	345	210	275	160	175			

1. No load duration increase allowed.
2. Allowable loads apply to wood with a specific gravity of 0.42 or greater.
3. Designer shall insure attached members are adequately designed to resist applied loads.
4. Straight line interpolation can be used to determine allowable loads for pitches between 3/12 and 9/12.
5. Nails: 10d = 0.148 dia. x 3" long.
Screws: #10 = #10 x $\frac{3}{4}$ " long self-drilling screws.
See pages 22-23 for other nail sizes and information.

The two nails at the bottom of the part (*the yoke end*) must be clinched

TSF Truss Spacer

The TSF is a fast and accurate method for spacing trusses that eliminates layout marking of top plates and can be left in place under the sheathing. Accuracy is improved, spacing errors are minimized, and it is easy to use.

MATERIAL: 24 gauge **FINISH:** Galvanized

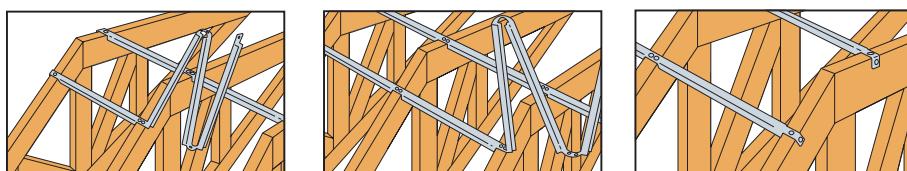

INSTALLATION:

- See Installation Sequence below.

- TSF Truss Spacers do not provide bracing of any kind and are not structural members. The TSF is for spacing only. Refer to instructions from architect, engineer, truss manufacturer or other for bracing and installation information.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Dimensions			Code Ref.
	W	O.C. Spacing	Total Length	
TSF2-16	1 $\frac{1}{2}$	16	8'	180
TSF2-24	1 $\frac{1}{2}$	24	10'	

STEP 1
Nail starting notch to first member.

STEP 2
As each successive member is positioned, unfold TSF to next notch. The notch teeth grip member and align it for nailing.

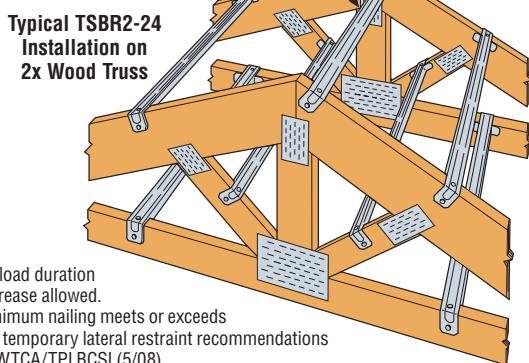

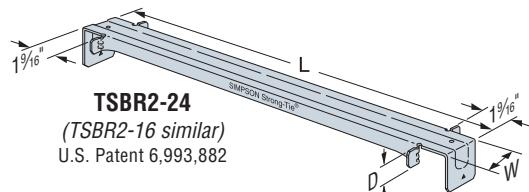

STEP 3
If spacer does not align with end truss, break spacer off at notch. Then, hammer spacer flat, fold it under and nail.

TSBR Truss Spacer-Restraint

The Simpson Strong-Tie® TSBR truss spacer-restraint is a time-saving lateral-restraint product for wood and CFS framing that improves quality and safety while helping to meet the prescriptive recommendations of the WTCA/TPI. Easier to install than wood bracing, the TSBR firmly grips the trusses, capturing on-center spacing and keeping them vertical and plumb after placement, resulting in a better truss installation. The unique design eliminates additional time spent measuring truss spacing and laying out temporary lateral bracing. And once installed, the TSBR can remain in place to be sheathed over, thereby eliminating the need to remove temporary bracing and creating a safer, more stable work platform.

FEATURES:**MATERIAL:** 22 gauge **FINISH:** Galvanized**INSTALLATION:** • Use all specified fasteners; see General Notes.**CODES:** See page 12 for Code Reference Key Chart.

Model No.	Dimensions (in)			Fasteners (Total)	Allowable Loads (lbs)				Code Ref.		
	L	W	D		DF/SP		SPF/HF				
					Compression	Tension	Compression	Tension			
TSBR2-16 ² (Min)	17½	1¼	1¼	2-10d	540	180	465	155	170		
TSBR2-16 (Max)	17½	1¼	1¼	4-10dx1½"	540	455	465	390			
TSBR2-24 ² (Min)	25½	1¼	1	2-10d	500	180	430	155	I13,		
TSBR2-24 (Max)	25½	1¼	1	4-10dx1½"	500	455	430	390	F12		

1. No load duration increase allowed.
2. Minimum nailing meets or exceeds the temporary lateral restraint recommendations of WTCA/TPI BCSI (5/08).
3. **NAILS:** 10dx1½" = 0.148" dia. x 1½" long, 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

TBD22 Diagonal Brace

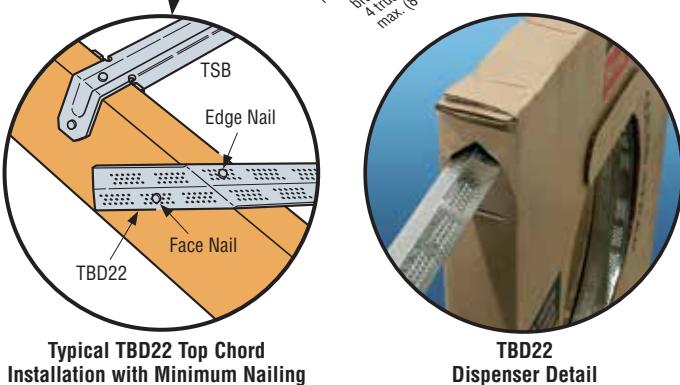

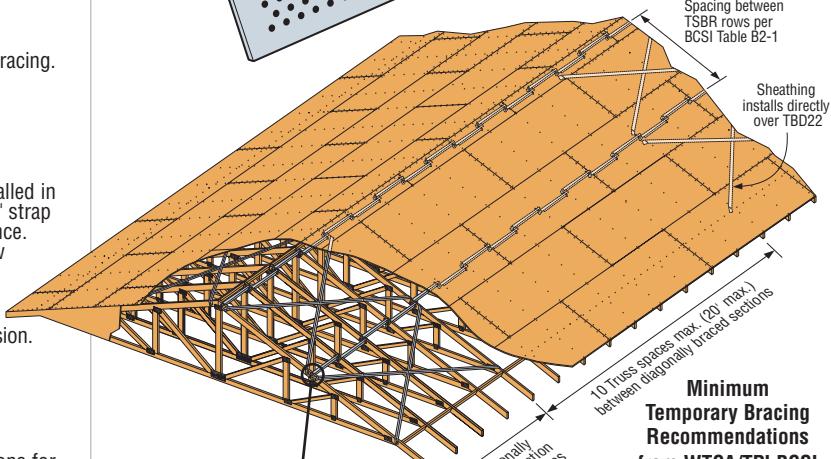

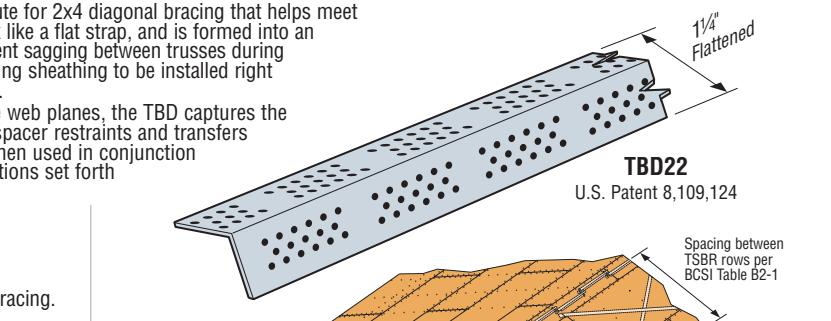

The TBD22 diagonal truss brace offers a time-saving substitute for 2x4 diagonal bracing that helps meet the recommendations of WTCA/TPI BCSI. The TBD travels in a box like a flat strap, and is formed into an A-shape as it is pulled from the carton to provide rigidity and prevent sagging between trusses during installation. As it is fastened to the trusses the brace flattens, allowing sheathing to be installed right over it and saving the time typically needed to remove 2x4 bracing.

When installed on the top and bottom chords as well as the web planes, the TBD captures the lateral construction and wind forces delivered by the TSBR truss spacer restraints and transfers it diagonally in tension to the edge of the braced-truss system. When used in conjunction with the TSBR, the TBD22 meets or exceeds the the recommendations set forth by the WTCA/TPI BCSI.

FEATURES: • Helps meet prescriptive temporary bracing recommendations of the WTCA/TPI BCSI.**MATERIAL:** 22 gauge **FINISH:** Galvanized**INSTALLATION:** • Use all specified fasteners; see General Notes.**CODES:** See page 12 for Code Reference Key Chart.

Model No.	Fasteners		Allowable Tension Loads		Code Ref.
	Strap Ends	Intermediate Trusses	DF/SP	SPF/HF	
TBD22 ² (Min)	1-10dx1½" in face and 1-10dx1½" in edge	1-10dx1½"	430	390	170
TBD22 (Max)	2-10dx1½" in face and 1-10dx1½" in edge	1-10dx1½"	565	520	

1. Allowable loads have been increased for construction and wind loading with no further increase allowed.
2. Minimum nailing meets or exceeds the temporary bracing recommendations of WTCA/TPI BCSI.
3. **NAILS:** 10dx1½" = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

Typical TBD22 Top Chord Installation with Minimum Nailing

TBD22 Dispenser Detail

TBE Truss Bearing Enhancers

The TBE transfers load from the truss or girder to plates for bearing-limited conditions and provides exceptional uplift capacity. Replaces nail-on scabs that provide lower load transfer, or in some cases, an additional ply when needed for bearing. One size works with any number of girder plies.

The table lists allowable loads for TBE4 used on 2x4 and TBE6 used on 2x6 top plates. The table gives the different loads calculated for TBE with and without wood bearing. See Fastener Schedule below and page 168 for Alternate Installation.

MATERIAL: 18 gauge

FINISH: Galvanized. See Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

- TBE must be installed in pairs.

- Top plate size is 2x4 for TBE4, 2x6 for TBE6. Use alternate installation for TBE4 and TBE6 on larger plates or pre-sheathed walls. See page 168.

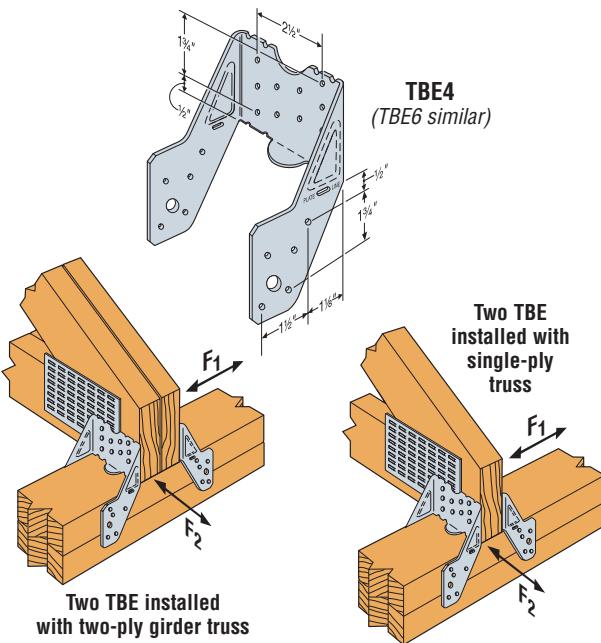

CODES: See page 12 for Code Reference Key Chart.

TBE FASTENER SCHEDULE

1. Loads are for a pair of TBEs.

2. When truss chord wood species is different than the wall top plate wood species, choose the tabulated allowable loads based on the species with the lower tabulated download capacity.

3. **Uplift and lateral** loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

4. Allowable loads are determined only by nail shear calculations or tests of the metal connectors based on the lowest of 0.125" of deflection or the ultimate load with a 3 times factor of safety. The attached wood members must be designed to withstand the loads imposed by the nails.

5. Perpendicular to Plate loads are reduced for Alternate Installation.

6. Parallel to Plate loads are not reduced for Alternate Installation.

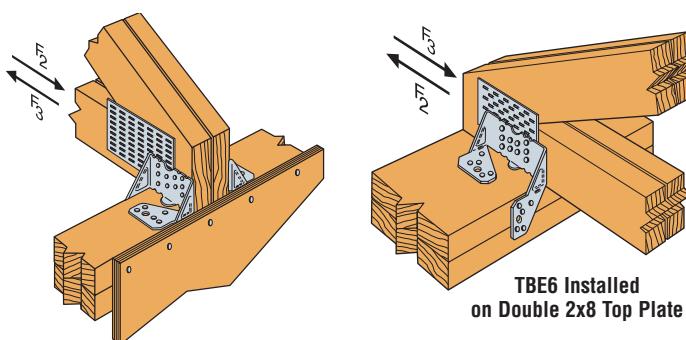

7. Equivalent Top Plate Bearing Width is the actual top plate width (TBE4 = 3 1/2", TBE6 = 5 1/2") plus the enhanced bearing width provided by the TBE.

TBE Truss Bearing Enhancers**ALTERNATE INSTALLATION**

(See illustrations at right)

Model No.	Alternate Installation Allowable Loads ^{5,6} Perpendicular to Plate

TBE6				

1. Use full table loads for uplift and parallel-to-plate allowable loads.
2. Download capacities are 0.80 of table loads.
3. See additional footnotes on page 167.

Pre-sheathed shearwall.
Bend tab along slot and nail
one leg to top of the plate.

Alternate Installation Allowable Down Loads
are 0.80 and Allowable Uplift Loads are 1.0
of the TBE only table loads on page 167.

TC Truss Connectors

The TC truss connector is an ideal connector for scissor trusses and can allow horizontal movement up to 1 1/4". The TC also attaches plated trusses to top plates or sill plates to resist uplift forces. Typically used on one or both ends of truss as determined by the Designer.

MATERIAL: 16 gauge **FINISH:** Galvanized

INSTALLATION:

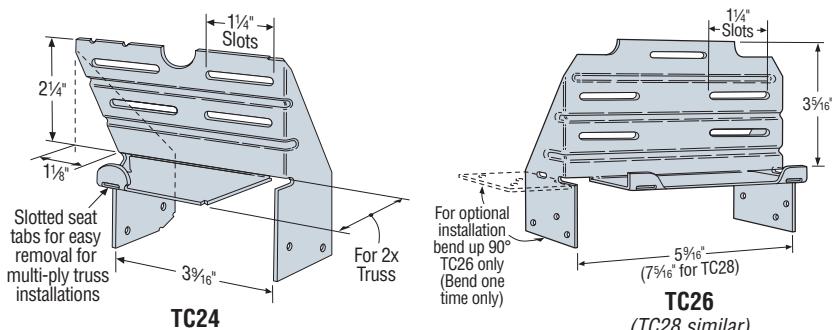

- Use all specified fasteners. See General Notes.
- Drive 10d nails into the truss at the inside end of the slotted holes (*inside end is towards the center of the truss and clinch on back side*). Do not seat these nails into the truss—allow room under the nail head for movement of the truss with respect to the wall.
- After installation of roofing materials nails may be required to be fully seated into the truss.

(As required by the Designer or Truss Designer.)

Optional TC Installation

- Bend one flange up 90°. Drive specified nails into the top and face of the top plates or install Titen® screws into the top and face of masonry wall. See optional load tables and installation details.

CODES: See page 12 for Code Reference Key Chart.

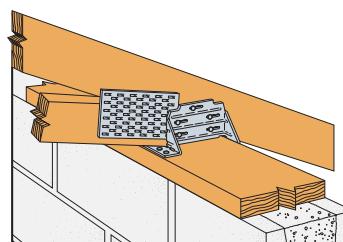

TC24

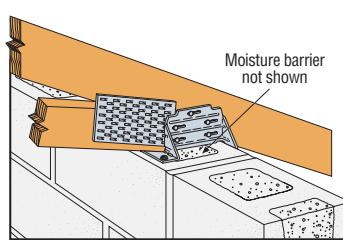

TC26

Typical TC24 Installation

Optional TC26 Installation for Grouted Concrete Block using a Wood Nailer (8", 10", 12" Wall Installation similar)

Optional TC26 Installation for Grouted Concrete Block using Titen Screws

See footnotes below.

OPTIONAL TC INSTALLATION TABLE

Model No.	Fasteners		DF/SP Allowable Loads	SPF/HF Allowable Loads	Code Ref.
	Truss	Plate	Uplift (160)	Uplift (160)	
TC24	4-10d	4-10d	400	345	I13, F12
TC26	5-10d	6-10d	665	570	
TC28	5-10d	6-10d	665	570	

1. Loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. Grout strength is 2000 psi minimum.
3. Nail values based on single 2x truss. 10d joist nails must be clinched.
4. Optional TC26 installation with 10d nails requires minimum 3" top plate thickness.
5. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1 1/2" = 0.148" dia. x 1 1/2" long.

See pages 22-23 for other nail sizes and information.

HTC Heavy Truss Clips

For alignment control between a roof truss and nonbearing walls; the $2\frac{1}{2}$ " slot permits vertical truss chord movement when loads are applied.

MATERIAL: 18 gauge

FINISH: Galvanized

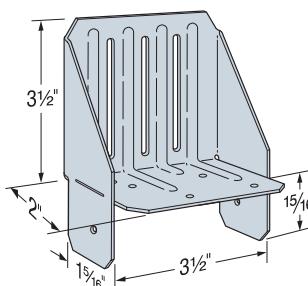

INSTALLATION: • Use all specified fasteners; see General Notes.

- The HTC has a $2\frac{1}{2}$ " slot to accommodate truss movement
- This connector has high lateral capacity.
- The S/HTC is available for steel truss applications.

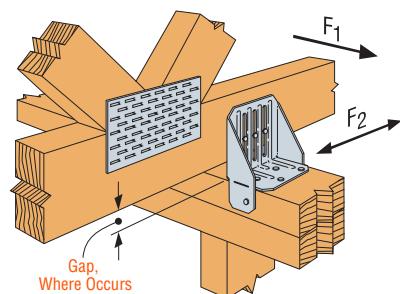

CODES: See page 12 for Code Reference Key Chart.

Model No.	Dimensions		Fasteners		Allowable Loads ¹ (160)				Code Ref.	
	Top Plate	Base	Slot	Without Gap ²		With $1\frac{1}{4}$ " Gap ³				
				F ₁	F ₂	F ₁	F ₂			
HTC4	2x4 Plate	6-10d	3-10d	390	305	85	280	170		
	2x6 Plate	6-10d	3-10d	485	280	155	280			

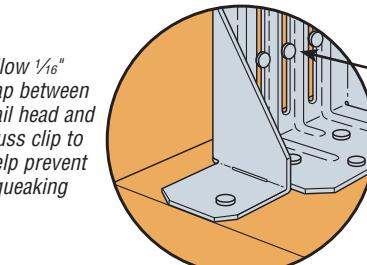

- Loads may not be increased for short-term loading.
- Truss or rafter must be bearing on top plate to achieve the allowable loads under "WITHOUT GAP."
- When installed with maximum $1\frac{1}{4}$ " space between rafter or truss and top plate use loads under "WITH $1\frac{1}{4}$ " GAP." Where loads are not required, space is not limited to $1\frac{1}{4}$ ".
- NAILS:** 10d = 0.148" dia. x 3" long.
See pages 22-23 for other nail sizes and information.

HTC4

Typical HTC4 Installation on a 2x4 Plate

Typical HTC4 Installation on a 2x6 or Larger Plate

Nails should not be driven completely flush against the connector, to allow vertical truss movement.

STC/STCT/DTC Roof Truss Clips

For alignment control between a roof truss and nonbearing walls; the $1\frac{1}{2}$ " slot permits vertical truss chord movement when loads are applied.

MATERIAL: 18 gauge

FINISH: Galvanized

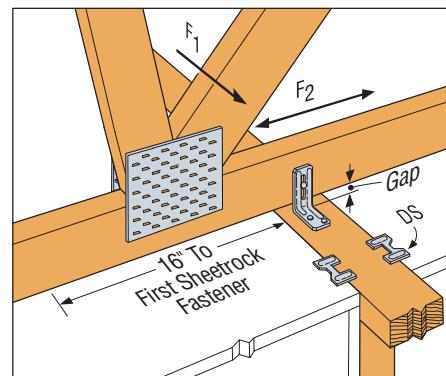

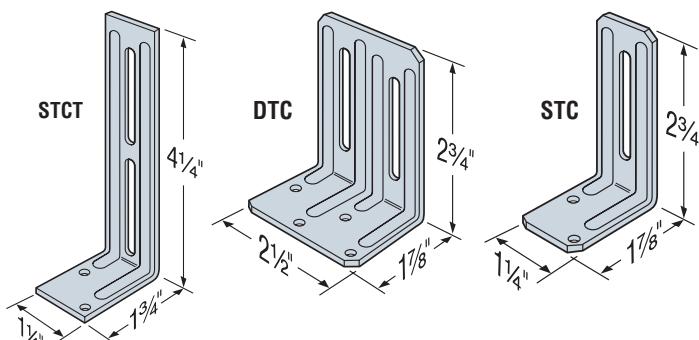

INSTALLATION: • Use all specified fasteners; see General Notes.

- Use STC or DTC depending on required loads. STC, installed with Drywall Stop (DS), helps prevent fasteners tearing through the ceiling sheetrock (see illustration).
- Use STCT where truss or rafter is separated from the top plate of the nonbearing wall.
- Install slot nails in the middle of the slot.
- Products not intended for floor applications due to the frequency of floor joist deflections and potential for squeaks.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Fasteners		Allowable Loads ¹ (160)						Code Ref.	
	Base	Slot	Without Gap ²		$\frac{1}{4}$ " Max Gap		$\frac{1}{4}" < \text{Gap} \leq \frac{1}{2}"$			
			F ₁	F ₂	F ₁	F ₂	F ₁	F ₂		
STC	2-8d	1-8d	85	55	35	35	30	40	170	
STCT	2-8d	1-8d	—	—	—	—	—	—		
DTC	4-8d	2-8d	125	210	85	135	55	70		

- Loads may not be increased for short-term loading.
- Truss or rafter must be bearing on top plate to achieve the allowable loads under "WITHOUT GAP."
- Clips are required on both sides of the truss to achieve F₁ loads in both directions (stagger parts to avoid nail interferences).
- NAILS:** 8d = 0.131" dia. x $2\frac{1}{2}$ " long.
See pages 22-23 for other nail sizes and information.

Typical STC Installation with DS

To allow vertical truss movement, nails should not be driven completely flush against the connector.

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The VTCR is single-sided valley truss clip that provides a positive connection between the valley truss and the supporting framing below. Installed on top of the roof sheathing, it eliminates the need to add a support wedge under the valley truss or to bevel the bottom chord to match the roof pitch.

- Single-sided for new construction or retrofit applications – can be installed after the valley truss is set in place
- Accommodates pitches from 0/12 to 12/12
- Can be installed on either beveled or non-beveled bottom chords
- Installs with nails or Simpson Strong-Tie® Strong-Drive® SD Connector screws

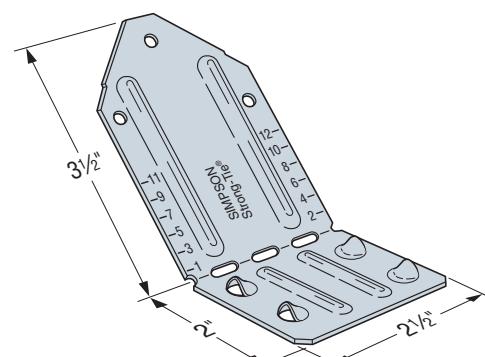

MATERIAL: 18 gauge **FINISH:** Galvanized

INSTALLATION:

- The dome holes assist in installing the fasteners into the supporting framing at approximately 45°.

CODES: See page 12 for Code Reference Key Chart.

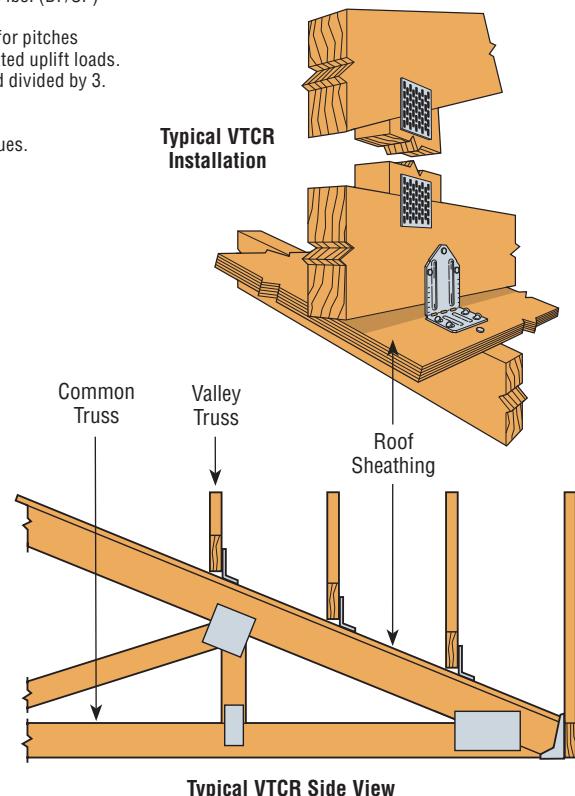

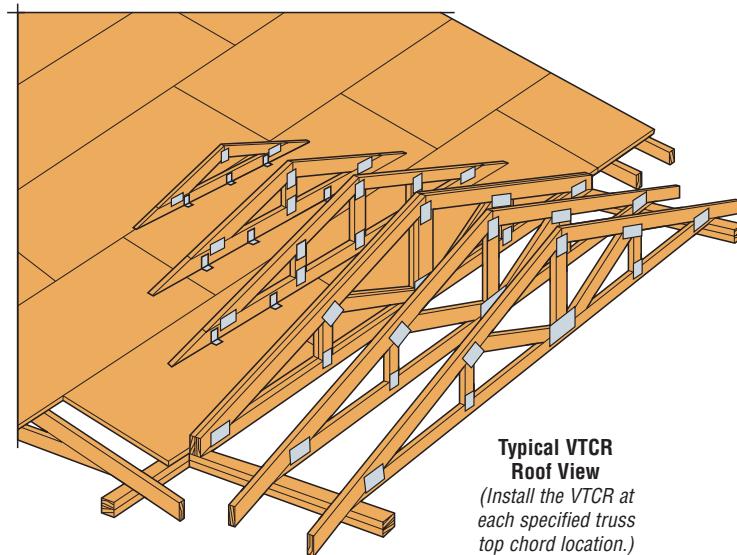

VTCR
U.S. Patent
D640,916

These products are approved for installation with the Strong-Drive® SD Connector screw.
See page 27 for more information.

Model No.	Fasteners		Supporting Roof Pitch	DF/SP Allowable Loads		SPF/HF Allowable Loads		Code Ref.
	Supporting Framing	Valley Truss		Uplift ³ (160)	Download ⁵ (100/115/125/160)	Uplift ³ (160)	Download ⁶ (100/115/125/160)	
VTCR	4-10d	3-10dx1 1/2"	< 4/12	370	790	320	655	I13, F12
			4/12 to 12/12	370	790	320	655	
	4-SD #9x2 1/2"	3-SD #9x1 1/2"	< 4/12	390	790	335	655	
			4/12 to 12/12	500	790	430	655	

1. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed.
2. Loads are based on installation over $\frac{1}{8}$ " or $\frac{15}{32}$ " sheathing. For installation over $\frac{19}{32}$ " or $\frac{3}{8}$ " sheathing, allowable uplift loads are 285 lbs. (DF/SP) and 245 lbs. (SPF/HF) when installed with nails, or 370 lbs. (DF/SP) and 320 lbs. (SPF/HF) when installed with screws.
3. When attached directly to the supporting framing with either screws or nails, the allowable uplift for pitches less than 4/12 is 240 lbs. (DF/SP) and 205 lbs. (SPF/HF). For pitches 4/12 to 12/12, use the tabulated uplift loads.
4. Allowable uplift loads are based on the lower of the test loads at $\frac{1}{8}$ " deflection or the ultimate load divided by 3.
5. Southern pine allowable download is 750 lbs.
6. Hem fir allowable download is 625 lbs.
7. When the valley truss and supporting framing are of different species, use the lower tabulated values.
8. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1 1/2" = 0.148" dia. x 1 1/2" long.
See pages 22-23 for other nail sizes and information.
9. **SCREWS:** SD #9x1 1/2" (model SD9112) = 0.131" dia. x 1 1/2" long,
SD #9x2 1/2" (model SD9212) = 0.131" dia. x 2 1/2" long.

GBC Gable Brace Connector

This product is preferable to similar connectors because of
a) easier installation, b) higher loads, c) lower installed cost,
or a combination of these features.

The GBC provides a proven, tested connection for the anchorage of building stability bracing to the top of the gable end wall. With allowable bracing installation angles between 40° to 60°, the GBC offers greater flexibility in a connector rated for both tension and compression loads.

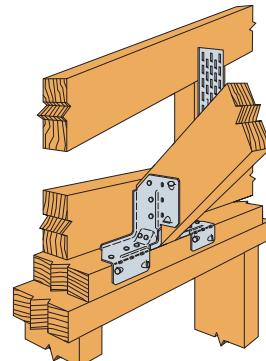

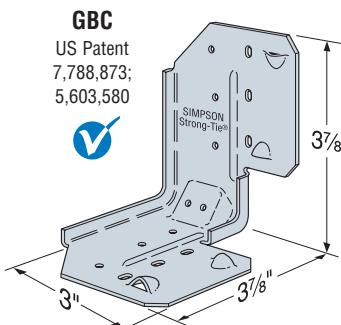

MATERIAL: 16 gauge

FINISH: Galvanized

INSTALLATION:

- Use all specified fasteners. See General Notes.
- The GBC must be installed in pairs to achieve full load capacity.

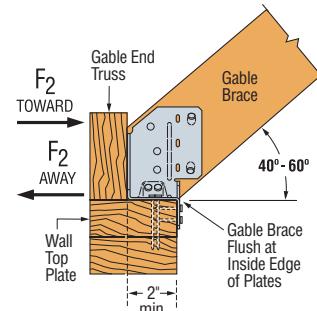

CODES: See page 12 for Code Reference Key Chart.

Typical GBC Installation

Model No.	Qty Req'd	Fasteners per Connector		DF/SP Allowable Loads (160) Perpendicular to Endwall (F ₂)				SPF/HF Allowable Loads (160) Perpendicular to Endwall (F ₂)				Code Ref.	
				Toward GBC		Away from GBC		Toward Anchors		Away from Anchors			
		Gable Brace	Top Plates	Gable Brace Angle	Gable Brace Angle	Gable Brace Angle	Gable Brace Angle	Gable Brace Angle	Gable Brace Angle	Gable Brace Angle	Gable Brace Angle		
GBC	2	5-8dx1 1/2	7-8d	635	570	425	325	535	480	355	275	I13, F12	

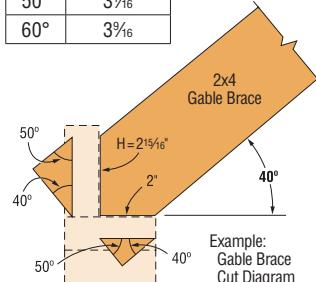

1. For 1 1/4 x 3 1/2 (or larger) LVL gable brace, the allowable load at 40° to 45° is 635 lbs. towards anchors, 515 lbs. away from anchors.
2. Loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
3. Use a minimum 2x4 gable brace. Larger members may be used.
4. **NAILS:** 8d = 0.131" dia. x 2 1/2" long, 8dx1 1/2 = 0.131" dia. x 1 1/2" long.
See pages 22-23 for other nail sizes and information.

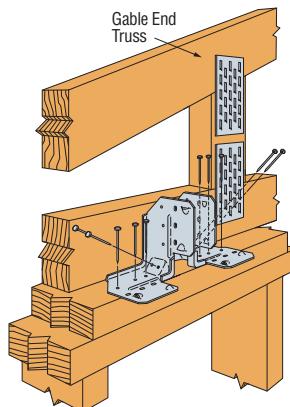

Typical Sloped Installation

GBC INSTALLATION SEQUENCE

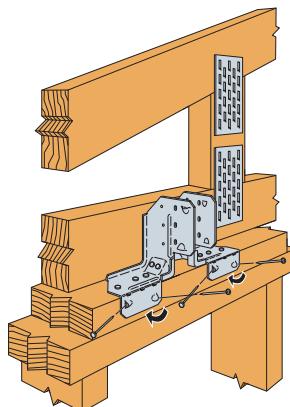

Slope	H Dimension
40°	2 5/16"
50°	3 1/16"
60°	3 3/16"

**STEP 1**

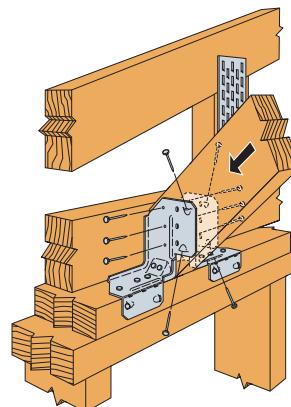

Double angle cut the gable brace to sit flat on the wall double top plate and flush against the gable end truss for 2x4 top plate. The double angle cuts should form a 90° angle on the end of the gable brace.

**STEP 2**

Set each GBC on top of the double top plate so that the bend line slots are flush with the inside edge of the double top plate. Install fasteners into the top of the double top plate.

**STEP 3**

Set each GBC on top of the double top plate so that the bend line slots are flush with the inside edge of the double top plate. Install fasteners into the top of the double top plate.

**STEP 4**

Install fasteners into the gable brace.

NOTE: Attach the other end of the gable brace to blocking at the roof diaphragm as directed by the Designer.

CHC Component Hoist Clip

The CHC component hoist clip provides a tested, load-rated solution for the safe lifting and placement of assembled wood components. The CHC is load-rated with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws for easy installation and removal, and superior shear and withdrawal strength during lifting.

FEATURES:

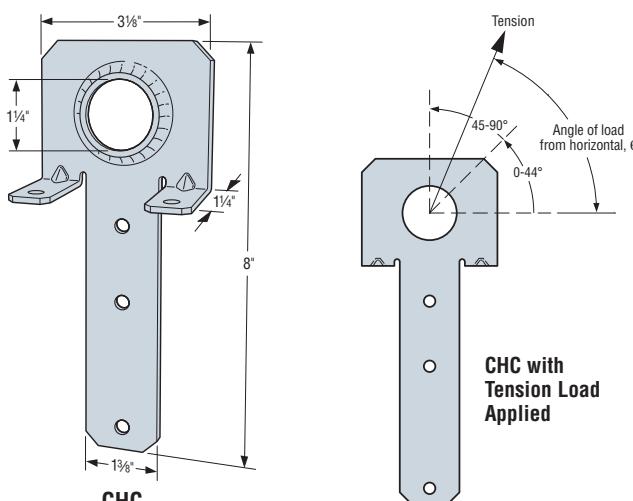

- Attaches easily to wood members using Strong-Drive SDS Heavy-Duty Connector screws (*sold separately*)
- May be used alone or in pairs for increased load
- Tested in multiple load directions for versatility

MATERIAL: 12 gauge **FINISH:** Galvanized

INSTALLATION:

- Use all specified fasteners. See General Notes.
- Fasteners require full penetration into the framing members.
- Use one time only.
- Lifting devices should be connected to the CHC with a closed-loop attachment of sufficient strength to carry the allowable load.

CODES: See page 12 for Code Reference Key Chart.

U.S. Patent 8,720,129

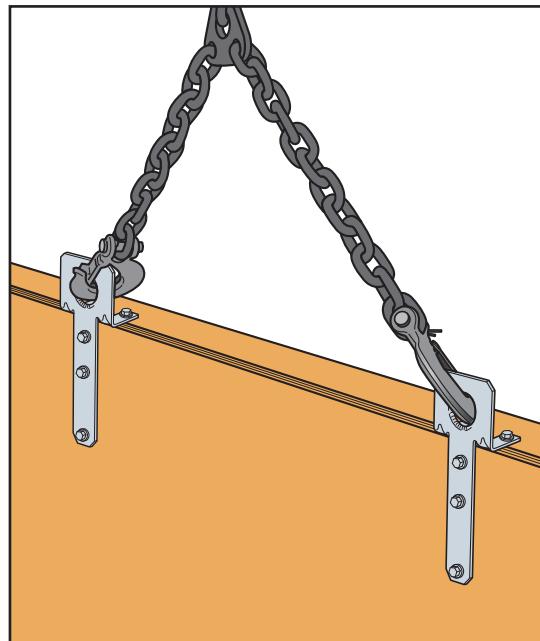

Single Part Allowable Loads

Model No.	Fasteners ⁴		Angle from Horizontal, θ	Allowable Tension DF/SP/SPF/HF (125)	Code Ref.
	Top	Face			
CHC	2-SDS 1/4"x3"	3-SDS 1/4"x3"	0-44	610	170
			45-90	975	

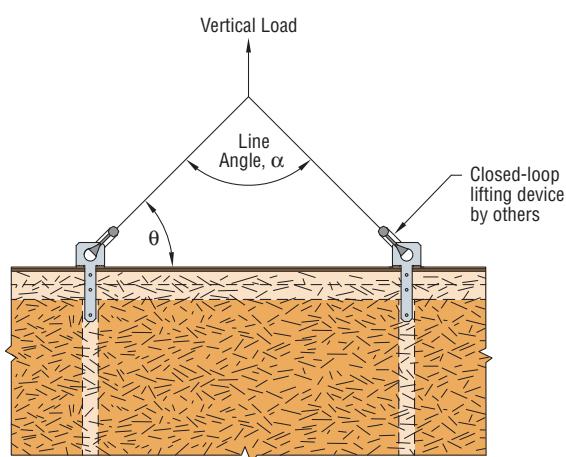

1. Allowable loads are based on the lowest ultimate test load of 3 test specimens, or the average of 6 specimens, divided by 5.
2. No load duration increase allowed.
3. Allowable loads are based on installation over sheathing on stud walls with double 2x top plates and max. $\frac{5}{8}$ " sheathing.
4. Fasteners require full penetration into the framing members.
5. All lifting devices and spreader bars that are used in conjunction with the CHC shall be of sufficient strength to carry the required load. Spreader bars must also have sufficient rigidity to resist bending of the lifted component.

Allowable Loads for Two Parts

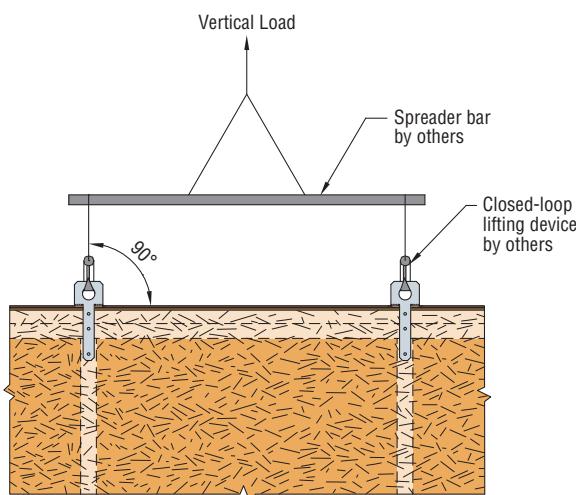

Model No.	Type of Connection	Angle from Horizontal, θ	Line Angle, α	Total Allowable Vertical Load DF/SP/SPF/HF (125)	Code Ref.

2 Typical CHC Installation with Spreader Bar

TITEN® Screws

Titen screws are $\frac{3}{16}$ " and $\frac{1}{4}$ " diameter masonry screws for attaching various components to concrete and masonry. Available in hex and phillips head and both carbon and stainless steel (see the Simpson Strong-Tie® Anchoring and Fastening Systems for Concrete and Masonry catalog for information on stainless steel versions). Use with appropriately sized Titen drill bits included with each box.

CODES: FL 2355.1

WARNING: Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Accordingly, use this product in dry and noncorrosive environments only or provide a moisture barrier.

Titen Screw Anchors for Concrete

Titen Diameter (in.)	Drill Bit Diameter (in.)	Embed. Depth (in.)	Critical Spacing (in.)	Critical Edge Dist. (in.)	Allowable Loads				Code Ref.	
					Concrete		CMU			
					Tension	Shear	Tension	Shear		
$\frac{3}{16}$	$\frac{5}{32}$	1	$2\frac{1}{4}$	$1\frac{1}{8}$	125	255	110	205	F35	
$\frac{3}{16}$	$\frac{5}{32}$	$1\frac{1}{2}$	$2\frac{1}{4}$	$1\frac{1}{8}$	305	415	—	—		
$\frac{1}{4}$	$\frac{3}{16}$	1	3	$1\frac{1}{2}$	145	225	150	250		
$\frac{1}{4}$	$\frac{3}{16}$	$1\frac{1}{2}$	3	$1\frac{1}{2}$	365	400	—	—		

1. Allowable loads may not be increased for short term loading due to wind or seismic forces.
2. Concrete shall have a minimum $f'_c = 2000$ psi. CMU is based on installation into face shell of hollow and grout-filled CMU.
3. The attached member or element may govern the allowable load. The designer shall verify allowable load.
4. Refer to the Simpson Strong-Tie® Anchoring and Fastening Systems for Concrete and Masonry catalog (form C-SAS) for complete information on the Titen screws.

Hex Head**

WM/WMI/WMU Hangers

See page 174 for sizes, fasteners and load information.

WMs are designed for use on standard 8" grouted masonry block wall construction.

MATERIAL: See table on page 174; WM, WMI, WMU—12 ga. top flange and stirrup

FINISH: Simpson Strong-Tie® gray paint; hot-dip galvanized available: specify HDG.

INSTALLATION:

- Use all specified fasteners.
- WM—two 16d duplex nails must be installed into the top flange and embedded into the grouted wall. Verify that the grouted wall can take the required fasteners specified in the table.

MID-WALL INSTALLATION:

Installed between blocks with duplex nails cast into grout with a minimum of one grouted course above and below the top flange and one #5 vertical rebar minimum 24" long in each adjacent cell.

TOP OF WALL INSTALLATION:

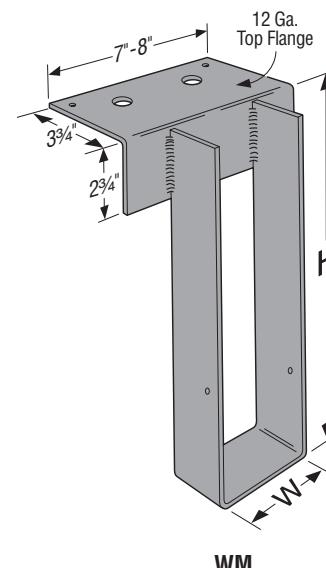

Install on top of wall to a grouted beam with masonry screws.

- Refer to technical bulletin T-SLOPEJST for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes (3:12).

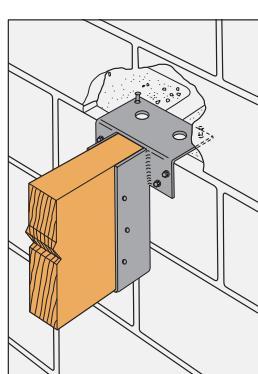

OPTIONS:

- WM/WMI may be skewed and/or sloped to 45° maximum with no reduction.
- WM/WMI top flange may be offset left or right for placement at the end of a header. The allowable load is 0.50 of the table roof load.
- See Hanger Options pages 233-243 for additional information.
- WMU may not be modified.

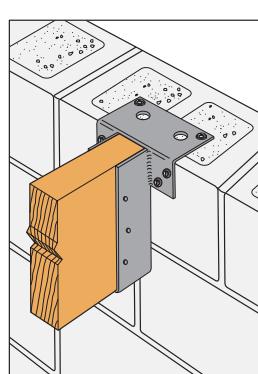

CODES: See page 12 for Code Reference Key Chart.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. See figures for Top-of-Wall and Mid-Wall installation. Minimum f_m = 1500 psi.
3. Products shall be installed such that Titen® screws are not exposed to weather.

4. For hanger heights that exceed the joist height, the allowable download is 0.50 of the table load.

5. **NAILS:** 16d Duplex = 0.162" dia. x 3½" long, 10dx1½ = 0.148" dia. x 1½" long.
See pages 22-23 for other nail sizes and information.

HU/HUC/HSUR/L Hangers

HU and HUC products are heavy duty face mount joist hangers made from 14 gauge galvanized steel.

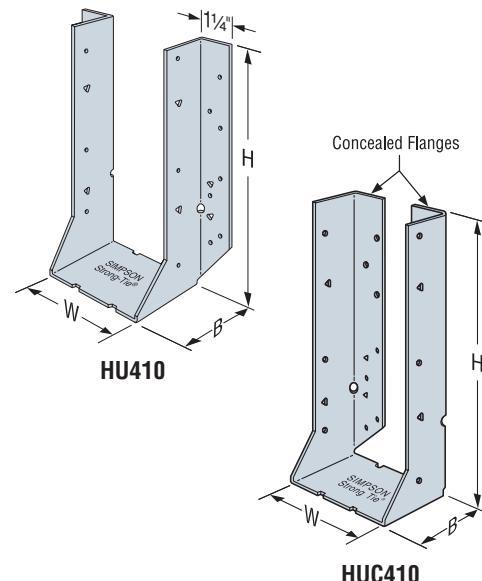

- The HUC is a concealed flange version of the HU. Concealed flange hangers have the header flanges turned in.
- HU is available with header flanges concealed, provided the W dimension is $2\frac{5}{16}$ " or greater, at 100% of the table load. Specify HUC.
- HU is available with one header flange concealed when the W dimension is less than $2\frac{5}{16}$ " at 100% of the table load.
- For allowable loads on HU products not listed in the table, request technical bulletin T-HUHUCTTN.

MATERIAL: 14 gauge

FINISH: Galvanized, ZMAX® and stainless steel available

- INSTALLATION:** • These hangers are attached to grouted CMU walls using $\frac{1}{4}" \times 2\frac{3}{4}"$ hex head Simpson Strong-Tie® Titon® screws or for concrete walls using $\frac{1}{4}" \times 1\frac{1}{4}"$ hex head Titon screws. Titon screws are not provided.
- Drill the $\frac{3}{16}"$ diameter hole to the specified embedment depth plus $\frac{1}{2}"$.
 - Alternatively, drill the $\frac{3}{16}"$ diameter hole to the specified embedment depth and blow it clean using compressed air.
 - Caution: Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with the base material and will reduce the anchor's load capacity.
 - The hangers should be installed such that a minimum end and edge distance of $1\frac{1}{2}"$ is maintained.
 - Provide moisture barrier between beam and wall per jurisdictional requirements.

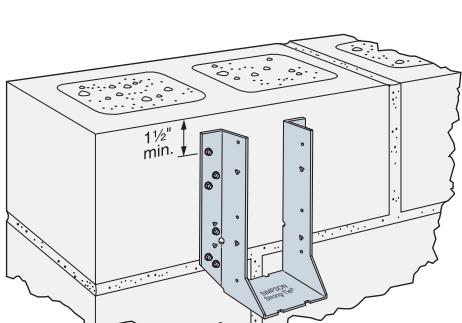

CODES: See page 12 for Code Reference Key Chart.

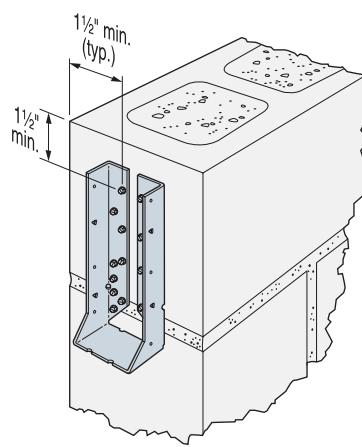

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- Uplift loads have been increased for wind or earthquake loading with no further increase is allowed. Reduce where other loads govern.
- Minimum concrete strength f'c shall be 2500 psi. CMU shall have a minimum grout strength of 2500 psi with standard ASTM C90 units and type N or S mortar.
- The HU28 can be ordered skewed 45° and achieve the same loads.
- See page 173 for Titon screw information. Use stainless-steel Titon® screws and products in exposed applications. Tabulated loads apply to stainless-steel applications.
- Noted loads for the HSUR/L shall be 0.8 the table loads for concrete applications.
- Table allowable loads were determined using tested lowest ultimate/3 or fastener calculation values.
- NAILS:** $16dx2\frac{1}{2} = 0.162"$ dia. x $2\frac{1}{2}"$ long, $10d = 0.148"$ dia. x 3" long, $10dx1\frac{1}{2} = 0.148"$ dia. x $1\frac{1}{2}"$ long. See pages 22-23 for other nail sizes and information.

LGUM/HGUM High Capacity Beam/Girder Hangers for Concrete/Masonry

High-capacity beam or girder hangers for concrete or masonry applications. Installation is made easier using Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws (*provided*) into the wood member and Titen HD® anchors (*provided*) into the masonry.

MATERIAL: See table **FINISH:** Galvanized

INSTALLATION: • Use all specified fasteners (*included*).

- Attach hanger to a concrete or grouted CMU wall using Titen HD anchors. Note the following:

- Drill holes using drill bits equal in diameter to the specified Titen HD anchor.
- Holes shall be drilled $\frac{1}{2}$ " deeper than the specified Titen HD length (i.e. $4\frac{1}{2}$ " for a 4" long Titen HD anchor)
- Caution: Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with the base material and will reduce the anchor's load capacity.

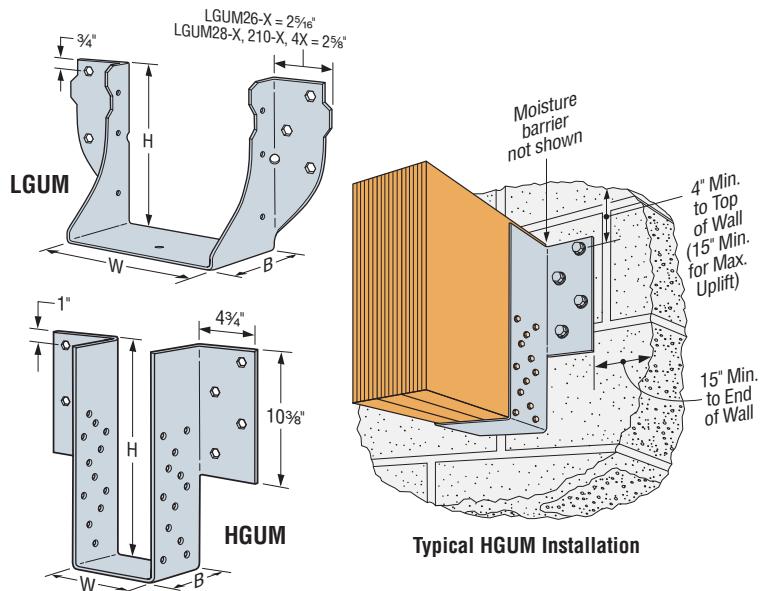

- Titen HD is not recommended for exposed exterior applications.
- Provide moisture barrier between beam and wall per jurisdictional requirements.

OPTIONS: • For HGUM only—Other seat widths available. Order as "X" version.

- HGUM available with one flange concealed.
- LGUM/HGUM available in skews up to 45°.

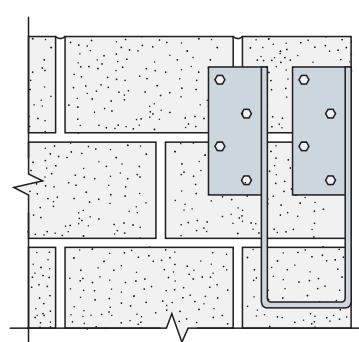

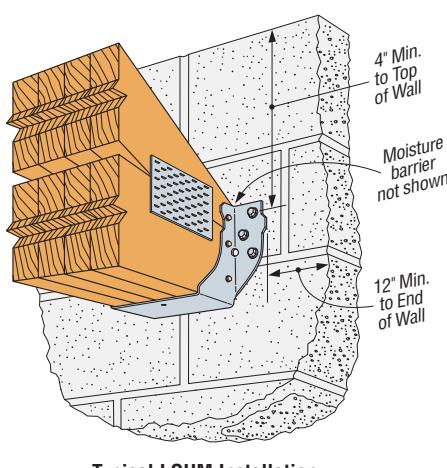

See Hanger Options, pages 233-243.

1. Uplift loads have been increased for wind or earthquake loading with no further increase is allowed.
2. HGUM uplift loads for concrete applications are 5840 lbs. with a 4" min. distance to top of wall and 6960 lbs. with a 15" min. distance to top of wall.
3. Minimum $f_m = 1500$ psi and $f_c = 2500$ psi.
4. LGUM must be installed on minimum 6" thick wall and HGUM on minimum 8" thick wall. (*Nominal values for CMU*)
5. Titen HD anchors may be installed into the head or bed joints.
6. Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Sections 7.5.3.4 and 8.9.2 are met (*pre-drilling required through the plate using a maximum of $\frac{5}{32}$ " bit*).

HGUM with right flange concealed
(See page 243 for reduction factors)

MBHU Masonry Beam Hangers

The new MBHU beam hanger provides a face-mounted solution for connecting beams to masonry or concrete walls. A non-welded, one-piece connector, the MBHU is suitable for solid sawn and engineered wood beams as well as trusses. Installation is simplified because the Titen HD® heavy-duty screw anchor and Strong-Drive® SDS Heavy-Duty Connector screws are included with the hanger. Since the Titen HD anchor is installed after the wall is built, locating the anchor in the right spot is easier than with cast-in-place bolts.

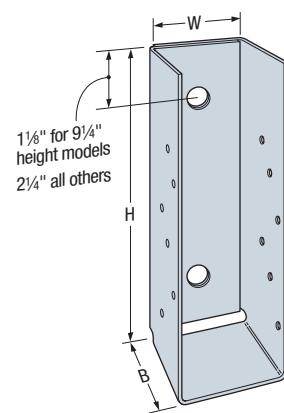

MATERIAL: 10 gauge

FINISH: Galvanized

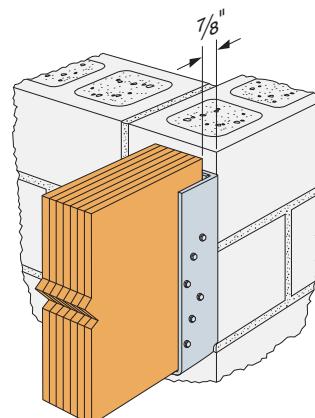

INSTALLATION: • Use all specified fasteners (*included*).

- Attach hanger to a concrete or grouted CMU wall using Titen HD anchors. Note the following:
 - Drill holes using drill bits equal in diameter to the specified Titen HD anchor.
 - Holes shall be drilled $\frac{1}{2}$ " deeper than the specified Titen HD length (*i.e.* $5\frac{1}{2}$ " for a 5" long Titen HD anchor)
 - Caution: Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with the base material and will reduce the anchor's load capacity.
- Titen HD is not recommended for exposed exterior applications.
- Provide moisture barrier between beam and wall per jurisdictional requirements.

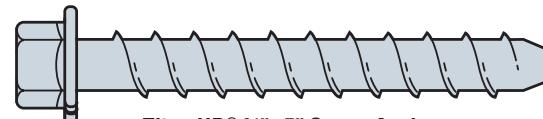

CODES: See page 12 for Code Reference Key Chart.

Systems for Concrete and Masonry catalog (form C-SAS).

5. MBHA hangers with height of 7 1/4" require a 3 1/2" minimum embedment of the face bolt using ET Epoxy-Tie adhesive. All thread rods to be 3/4" diameter, grade A307 or better.

6. Additional anchorage products to be designed by others.

7. Uplift loads are for Southern Pine. For Doug Fir use 3515 lbs.

8. Table allowable loads were determined using test ultimate/3 or fastener calculation values.

9. **NAILS:** 10d = 0.148" dia. x 3" long.

See pages 22-23 for other nail sizes and information.

H Seismic & Hurricane Ties / LTA2 Lateral Truss Anchor

The Hurricane Tie series features various configurations of wind and seismic ties for trusses and rafters.

The H10S provides a high capacity connection from truss/rafter to wall. Also suitable for wood-to-wood applications (see page 196).

The HM9 is designed to retrofit roof truss/rafters for block construction. The HM9 hurricane tie provides high uplift and lateral capacity using Simpson Strong-Tie® concrete fasteners.

The presloped 5/12 seat of the H16 provides for a tight fit and reduced deflection. The strap length provides for various truss heights up to a maximum of 13 1/2". Minimum heel height for H16 series is 4".

The new LTA2 is an embedded truss anchor for grouted CMU and concrete walls that develops high loads with shallow embedment. Designed for 2x4 minimum truss chords, the LTA2 resists uplift and lateral loads parallel and perpendicular to the wall with a minimum heel height requirement.

FEATURES:

- Simplified design of the embedded portion allows for easy positioning close to rebar
- Ideal for anchoring trusses running perpendicular or parallel to the wall
- Embedment line stamped on part simplifies installation and helps avoid installation errors

MATERIAL: H Ties—see table; LTA2—18 gauge

FINISH: Galvanized; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

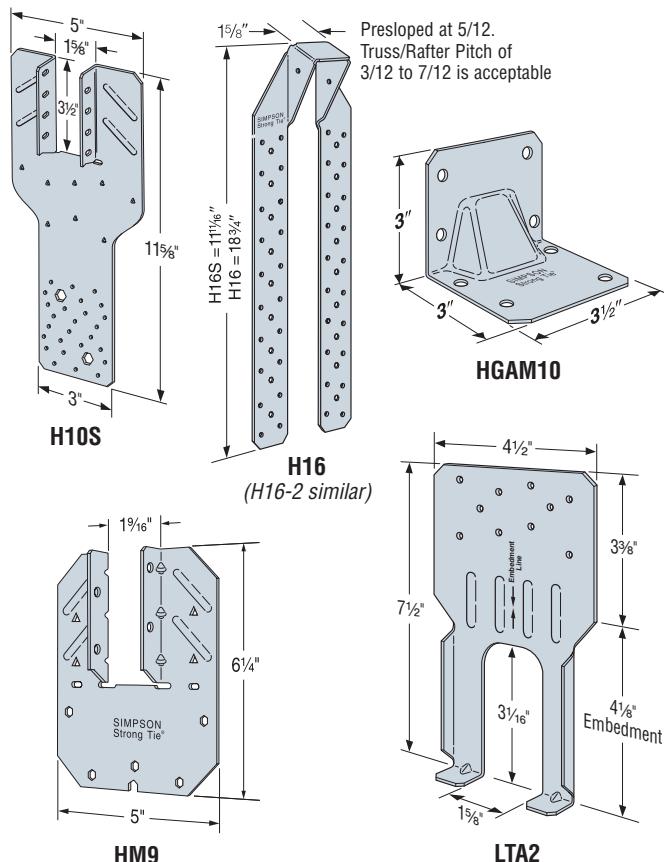

H Ties:

- Connectors attached using hex head Simpson Strong-Tie® Titon® screws.
- Attach to grouted concrete block with a minimum one #5 rebar horizontal in the course.
- Hurricane Ties do not replace solid blocking.

LTA2:

- Whether in grouted CMU or concrete, the LTA2 must be embedded to the depth of the embedment line stamped on the part.
- A minimum of one horizontal #5 rebar is required at top of concrete or in the top course of grouted CMU.
- For parallel-to-wall applications, install the LTA2 with flanges facing the center of the wall. Minimum edge distance of 1 1/2" required.

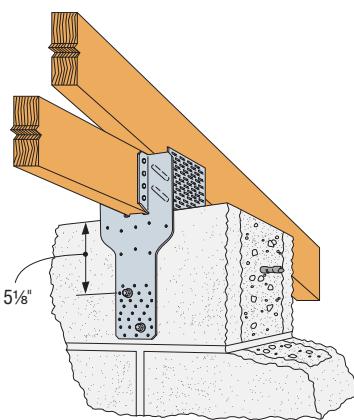

CODES: See page 12 for Code Reference Key Chart.

1. Loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Allowable loads are for one anchor. A minimum rafter thickness of 2¹/₂" must be used when framing anchors are installed on each side of the joist and on the same side of the plate.
3. The HM9KT and HGAM10KTA are kits with (20) HM9 and (10) HGAM10 connectors packaged with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws and 2¹/₄" and 2³/₄" Titen® screws, respectively. (1¹/₄" Titen screws for concrete installations sold separately.)
4. See page 173 for Titen screw information.

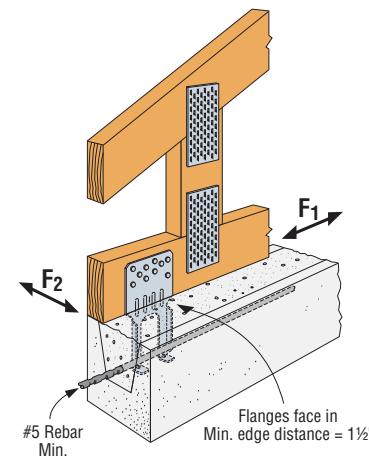

5. Table allowable loads were determined using test ultimate/3 or fastener calculation values.
6. Products shall be installed such that the Titen screws and Titen HD® anchors are not exposed to the weather.
7. HGAM10 F₂ loads are for forces into the connector. See illustration 2 for loads away from the connector.
8. LTA2 allowable uplift on SP is 1425 lbs. for perpendicular to wall installation and 1390 lbs. for parallel to wall installation.
9. **NAILS:** 10dx1¹/₂ = 0.148" dia. x 1¹/₂" long, 8dx1¹/₂ = 0.131" dia. x 1¹/₂" long. See pages 22-23 for other nail sizes and information.

① H16S Installed into Masonry

② HGAM10 Installed into Masonry

③ HM9 Attaching Truss to Masonry

META/HETA/HHETA/HETAL/DETAL/TSS *Embedded Truss Anchors and Truss Seat Snap-In*

The embedded truss anchor series provides an engineered method to properly attach roof trusses to concrete and masonry walls. The products are designed with staggered nail patterns for greater uplift resistance. Information regarding the use of two anchors on single- and multi-ply trusses is included.

The TSS, a companion product of the META, provides a moisture barrier between the concrete and truss. The preassembled unit is riveted with no height adjustment.

The DETAL20 is a high capacity embedded truss anchor for attachment of single-ply trusses to concrete and masonry walls. It combines dual embedded anchors with a structural moisture-barrier seat that is partially embedded in the concrete or grout. This seat serves to protect the truss and also provides additional lateral and uplift capacity. The embedded anchors are pre-attached to the moisture barrier through slots that allow for a slight amount of adjustability, providing flexibility during installation to avoid rebar. The moisture-barrier seat includes tabs at each end for optional attachment to the form board in concrete tie-beam applications.

MATERIAL: HHETA-14 gauge; HETA-16 gauge;
HETAL-strap 16 gauge, truss seat 18 gauge;
META-18 gauge; TSS-22 gauge;
DETAL-16 gauge (*Barrier-18 gauge*)

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners.

See General Notes.

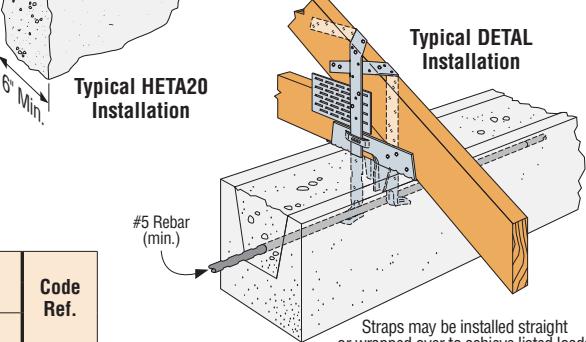

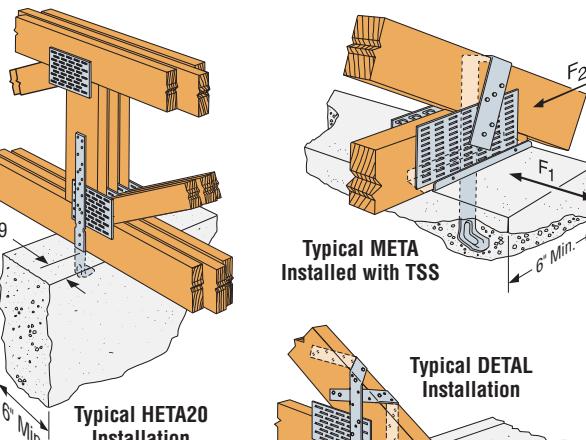

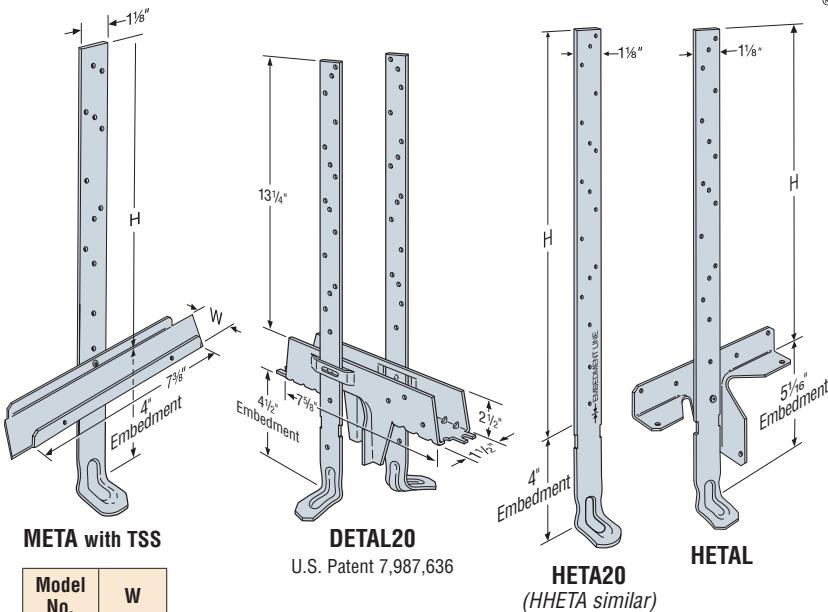

- The META, HETA and HHETA are embedded 4" into a 6" min. concrete beam or 8" nominal grouted block wall; HETAL is embedded 5½"; DETAL is embedded 4½".
- The DETAL20 is installed centered and flush on top of an 8" masonry bond beam or concrete tie beam. The moisture barrier seat bears on masonry face shell or concrete tie beam form boards; the two flanges embed into grout or concrete. The two embedded anchors shall be installed vertically into grout or concrete.
- The TSS moisture barrier may be preattached to the truss using 6d commons.
- For mislocated truss anchors which are greater than ¼" but less than 1½" from the face of the truss, a shim must be provided. Shim design by Truss Engineer. When gap is greater than 1½", install new anchors.
- In double embedded anchor installations, do not install fasteners where the straps overlap when wrapped over the truss heel.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

1. Loads have been increased for wind or seismic loading. Reduce where other loads govern.
 2. Minimum f'c = 2500 psi. Minimum f'm = 1500 psi.
 3. For simultaneous loads in more than one direction, the connector must be evaluated as described in Note e, page xx under Instructions to the Designer.
 4. Five nails must be installed into the truss seat of the HETAL.
 5. Parallel-to-wall load towards face of HETAL is 1975 lbs.
 6. It is acceptable to use a reduced number of fasteners provided that there is a reduction in uplift load capacity. See example on page 190. Lateral loads do not apply when fewer than 7 fasteners are used with the HETA and HHETA anchors or less than 6-16d or 7-10dx1½ fasteners are used with the META anchor.
 7. The HHETA allowable F1 load can be increased to 435 lbs. if the strap is wrapped over the truss and a minimum of 12 nails are installed.
 8. Minimum spacing for multiple anchor installation is 2 times the embedment depth for full load. See Double Embedded Anchor Installation table on page 181 for loads on closer spaced anchors.
 9. Minimum edge distance for HETA/META is 1½" for concrete and 2" for masonry.
 10. **NAILS:** 16d = 0.162" dia. x 3½" long,
 10dx1½ = 0.148" dia. x 1½" long.
 See pages 22-23 for other nail sizes and information.

Double Embedded Anchor Installation

Model No.	Qty.	Application	SP Uplift Load Capacity (160)				Code Ref.	
			1 Ply		2 or 3 Ply			
			Fasteners ⁵	Load	Fasteners ⁵	Load		
DETAL20	1	CMU	18-10dx1½	2480	—	—	F27	
		Concrete	18-10dx1½	2480	—	—		
META	2	CMU	10-10dx1½	1985	14-16d	1900	F27	
		Concrete	10-10dx1½	1985	14-16d	2565		
HETA	2	CMU	10-10dx1½	2035	12-16d	2500	F27	
		Concrete	10-10dx1½	2035	12-16d	2700		
HHETA	2	CMU	10-10dx1½	2035	12-16d	2500	F27	
		Concrete	10-10dx1½	2035	14-16d ⁸	3350		

1. Loads include a 60% load duration increase on the fasteners for wind or seismic loading.
2. Minimum $f'_c = 2500$ psi. Minimum $f'_m = 1500$ psi.
3. For simultaneous loads in more than one direction, the connector must be evaluated as described in Note e, page xx under General Instructions for the Designer.
4. Install with spoons facing outward and straps spaced no more than $\frac{1}{8}$ " wider than the truss width.
5. The DETAL20 requires 6-10dx1½" nails in the truss seat and 6-10dx1½" nails into each strap. For all other models, install half of the required fasteners in each strap.
6. Lateral loads for META, HETA and HHETA anchors apply only to 2- or 3-ply applications with anchors spaced a minimum of 3" apart. For single-ply applications use lateral loads from the Single Embedded Anchor Installation table on page 180. DETAL lateral loads apply for single-ply application.
7. F_1 lateral loads listed may cause an additional $\frac{1}{16}$ " deflection beyond the standard $\frac{1}{8}$ " limit where the straps are installed not wrapped over the heel as shown.
8. Two HHETA anchors may be installed in a concrete tie beam on a 2- or 3-ply truss with 2 fewer nails for an allowable uplift load of 3050 lbs.
9. Noted F_1 lateral loads for the DETAL20 may cause an additional $\frac{1}{32}$ " deflection beyond the standard $\frac{1}{8}$ " limit.
10. Single-ply trusses may use either 10dx1½" or 16d nails with allowable loads limited to the single-ply column. 2- or 3-ply trusses shall use 16d nails.
11. **NAILS:** 16d = 0.162" dia. x 3½" long, 10dx1½" = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

MSTAM/MSTCM Straps Ties

MSTAM and MSTCM models are designed for wood to masonry applications.

The MSTC series has countersunk nail slots for a lower nailing profile.

FINISH: Galvanized. Some products are available in stainless steel or ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION:

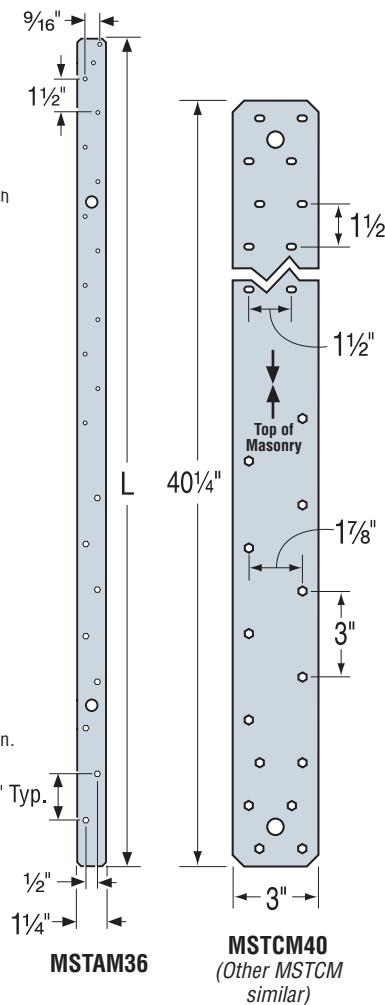

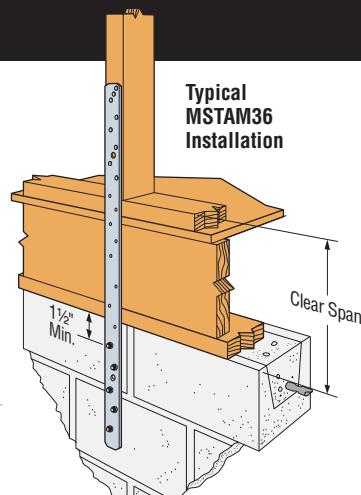

- Use all specified fasteners. See General Notes.
- Attaches to grouted concrete block and wood framing.
- Minimum end and edge distance for Titen® screws is 1½".

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Masonry Application

Model No.	Ga	Dimensions		Fasteners (Total)			Allowable Tension/Uplift Loads (DF/SP (160) SPF/HF (160))	Code Ref.
		W	L	Nails	CMU	Concrete		
MSTAM24	18	1¼	24	9-10d	5-½x2½ Titen	5-½x1¾ Titen	1500 1500	F27
MSTAM36	16	1¼	36	13-10d	8-½x2½ Titen	8-½x1¾ Titen	1870 1870	
MSTCM40	16	3	40½	26-16d sinkers	14-½x2½ Titen	14-½x1¾ Titen	4220 4220	
MSTCM60	16	3	59½	26-16d sinkers	14-½x2½ Titen	14-½x1¾ Titen	4220 4220	

1. Loads include a 60% load duration increase on the fasteners for wind or earthquake loading.

2. Minimum edge distance 1½" using Titen® screws.

3. Minimum $f'_m = 1500$ psi and $f'_c = 2500$ psi.

4. Products shall be installed such that the Titen screws are not exposed to the weather.

5. See page 173 for Titen screw information.

6. **NAILS:** 16d Sinker = 0.148" dia. x 3½" long, 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

Floor-to-Floor Clear Span Table

Model No.	Clear Span	Fasteners (Total)			Allowable Tension/Uplift Loads (DF/SP (160) SPF/HF (160))	Code Ref.

	26½	20-16d sinkers	14-½x2½ Titen	14-½x1¾ Titen	3840 3320	

See notes above.

MTSM/HTSM Twist Straps

The MTSM and HTSM offer high strength truss-to-masonry connections.

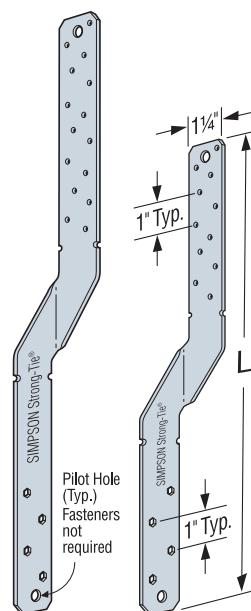

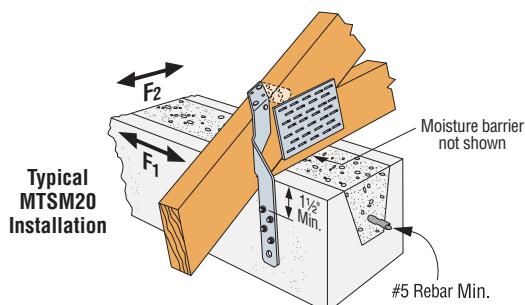

MATERIAL: MTSM—16 gauge; HTSM—14 gauge

FINISH: Galvanized. See Corrosion Information, pages 13–15.

INSTALLATION:

- Use all specified fasteners. See General Notes.
- Installs with hex-head Titen® screws.
- Attach to either side of grouted concrete block with a minimum one #5 rebar horizontal.

CODES: See page 12 for Code Reference Key Chart.

HTSM20
(**MTSM20**
similar)

MTSM16
(**HTSM16**
similar)

1. Loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Twist straps do not have to be wrapped over the truss to achieve the allowable load.
3. Minimum edge distance for Titen screw is 1 1/2".
4. See page 173 for Titen screw information.
5. Table allowable loads were determined using test ultimate/3 or fastener calculation values.
6. Products shall be installed such that the Titen screws are not exposed to the weather.
7. Minimum $f'm = 1500$ psi and $f'c = 2500$ psi.
8. Lateral loads apply when on the wall side Titen screws are installed into the first four hexagonal holes from the bend line and on the truss/rafter the first seven nail holes near the bend line are filled. Any other fasteners required can be installed in any open hole.
9. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1 1/2" = 0.148" dia. x 1 1/2" long. See pages 22–23 for other nail sizes and information.

MGT/HGT Girder Tiedowns

The MGT and HGT series are girder tie downs for moderate to high load applications that are typically installed prior to roof sheathing. The MGT wraps over the heel and is anchored on one side of the truss. The HGT straddles the heel and anchors on both sides of the truss. The HGT is field adjustable, making it suitable for trusses with top chord slopes up to 8/12. The HGT is available in sizes for 2-, 3- and 4-ply widths.

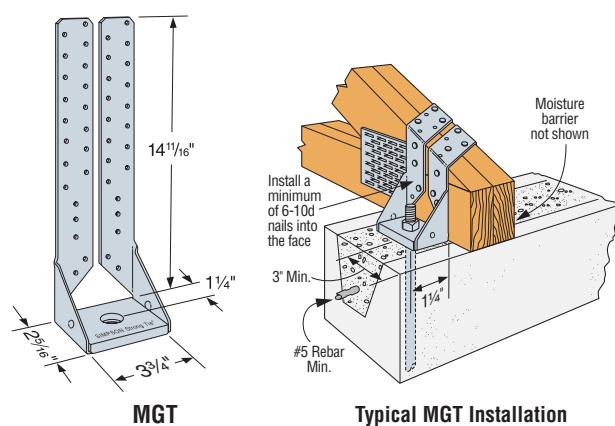

MATERIAL: MGT—12 gauge; HGT—7 gauge

FINISH: MGT—Galvanized; HGT—Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners. See General Notes.

- When the HGT-3 is used with a 2-ply girder or beam, shimming is required and must be fastened to act as one unit.
- Attach to grouted concrete block with a minimum one #5 rebar horizontal in the top lintel block.
- See page 204 for wood applications.

CODES: See page 12 for Code Reference Key Chart.

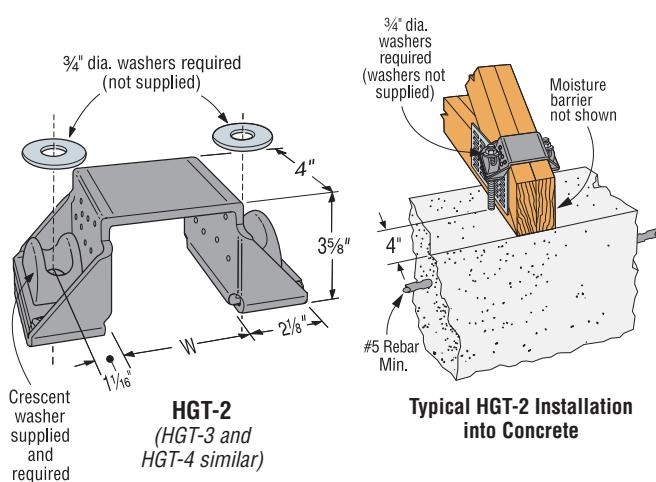

MGT

Typical MGT Installation

Model No.	W	O.C. Dim Between Anchors	Fasteners		DF/SP Allowable Uplift Loads (160)	SPF/HF Allowable Uplift Loads (160)	Code Ref.
			Concrete/CMU	Girder			
MGT	3 3/4	—	1- 5/8	22-10d	3965	3330	F26
HGT-2	3 5/16	5 1/4	2- 3/4	16-10d	10980	6485	I20, F19
HGT-3	4 1/16	7 1/2	2- 3/4	16-10d	10530	9035	
HGT-4	6 1/16	9	2- 3/4	16-10d	9250	9250	

1. Attached members must be designed to resist applied loads.
2. Minimum $f'm = 1500$ psi and $f'c = 2500$ psi.
3. To achieve the loads listed for the MGT and HGT, anchorage into a 8" wide concrete tie-beam or grouted and reinforced CMU tie-beam can be made using Simpson Strong-Tie® SET Epoxy-Tie® adhesive with a minimum embedment depth of 12". Vertical reinforcement may be required to transfer the loads per Designer.
4. Allowable loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
5. The MGT can be installed with straps vertical for full table load provided all specified nails are installed to either a solid header or minimum double 2x6 web.
6. Table allowable loads were determined using tested lowest ultimate/3 or fastener calculation values.
7. **NAILS:** 10d = 0.148" dia. x 3" long. See pages 22–23 for other nail sizes and information.

HGT-2
(**HGT-3** and
HGT-4 similar)

Typical HGT-2 Installation into Concrete

FGTR/LGT/VGT Retrofit Girder Tiedowns

The LGT, VGT and FGTR products are moderate to high load capacity girder tie-downs for new or retrofit applications.

LGT connectors provide a low profile connection to the wall for easy installation of drywall. Simple to install and can be installed on the inside or outside of the wall.

The Variable Girder Tiedown (VGT) is a higher capacity alternative to the LGT and MGT for girder trusses. It attaches with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws to the side of truss and features a predeflected crescent washer that allows it to accommodate top chord pitches up to 8/12. The VGT is also available with one flange concealed for attachment to trusses with no tail.

The Face Mount Girder Tie-Down (FGTR) is a non-pitch specific girder tiedown that offers the highest uplift capacity for retrofit applications. The FGTRHL/R is designed for corner hip applications.

MATERIAL: VGT—7 gauge; LGT2—14 gauge; LGT3/LGT4—12 gauge;

FGTR—Straps: 7 gauge, Plate: 3 gauge

FINISH: VGT, LGT—Galvanized; FGTR—Powder Coated

INSTALLATION: • Use all specified fasteners. See General Notes.

- Connectors attached using Titen® screws shall have hex heads.
- To achieve the loads listed in the table below, the product shall be attached to a grouted and reinforced block wall or a reinforced concrete wall designed by others to transfer the high concentrated uplift loads to the foundation.
- Strong-Drive SDS screws included with LGT3, LGT4, VGT Series and FGTR Series.

VGT/FGTR:

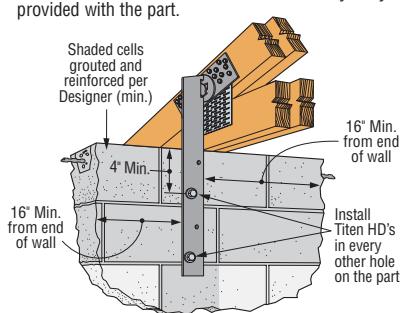

- Screw holes are configured to allow for double installation on a two-ply (*minimum*) truss.
- The product can be installed in a single application or in pairs to achieve a higher uplift capacity.
- Can be installed on roof pitches up to 8/12 or on a bottom chord designed to transfer the loads.
- FGTR—Only 2 of the 4 holes provided on each strap are required to be filled to achieve the catalog loads. The first Titen HD® anchor $\frac{1}{8}$ "x5" (THD) shall be installed a minimum of 4" from the top of the wall. Fasteners shall not be installed in adjacent holes.
- VGT—When installed on trusses with no overhangs, specify VGTR/L.
- VGT—Install washer component (*provided*) so that top of washer is horizontal as well as parallel with top of wall.

OPTIONS: LGT3 is available with reduced widths of W = $4\frac{1}{16}$ " – order as LGT3N-SDS2.5.
CODES: See page 12 for Code Reference Key Chart.

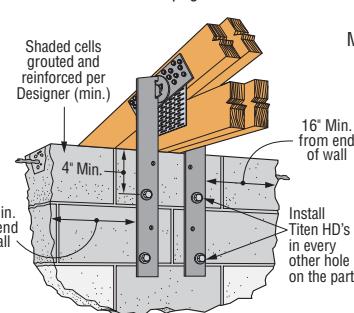

Model No.	Qty.	No. of Plies	Fasteners		Allowable Uplift Load (160)		Code Ref.

FGTRHL/R	1	2 ply min.	18-SDS $\frac{1}{4}$ "x3"	2-1/2x5 Titen HD	3850	2770	

1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. To achieve the loads listed for the VGT single and double connector options, anchorage into a 8" wide concrete tie-beam or grouted and reinforced CMU tie-beam can be made using Simpson Strong-Tie® SET Epoxy-Tie® adhesive with a minimum embedment depth of 12", a minimum end distance of 12" and centered in the 8" member. Vertical reinforcement may be required to transfer the loads per Designer.
3. Minimum concrete strength f_c shall be 2500 psi. CMU shall have a minimum grout strength of 2500 psi with standard ASTM C90 units and type N or S mortar.
4. FGTR—Minimum edge distance for Titen HD anchor is 4".
5. FGTR—Titen HD anchors should be spaced in every other hole on the part.
6. FGTR—The Titen HD anchors and SDS Heavy-Duty Connector screws are provided with the part.

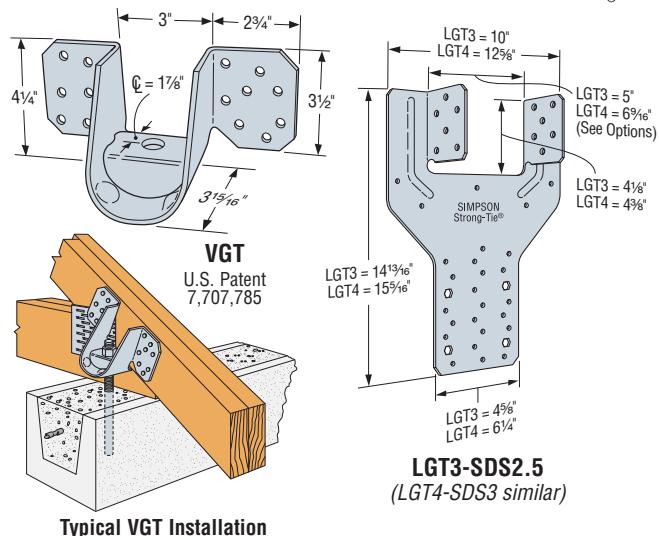

7. LGT2— F_1 load = 700, F_2 load = 170.
8. See page 173 for Titen screw information.
9. Table allowable loads were determined using tested lowest ultimate/3 or fastener calculation values.
10. Products shall be installed such that the Titen screws and Titen HD anchors are not exposed to the weather.
11. For concrete wall applications use $\frac{1}{4}$ x1 1/4 Titen screws.
12. Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Sections 7.5.3.4 and 8.9.2 are met (*pre-drilling required through the plate using a maximum of $\frac{5}{32}$ " bit*).
13. **NAILS:** 16d Sinker = 0.148" dia. x 3 1/4" long.
See pages 22-23 for other nail sizes and information.

CCQM/CCTQM/ECCLQM/CCCQM/ECCLQMD

Column Caps for CMU and Concrete Piers

SIMPSON**Strong-Tie**

The CCQM/CCTQM/CCCQM/ECCLQM embedded column caps are designed for use in raised pier foundations and applications where heavy timbers rest on concrete or concrete block columns. The heavy-gauge beam seats and unique SSTB-style anchor bolts provide the high uplift and lateral resistance needed to help resist high wind events. The new ECCLQMD is a variation that incorporates an additional seat to support a third member at the corner connection. **The new CCCQM is a variation that incorporates a stirrup on each side for intermediate support beams perpendicular to the main channel.**

Framing is fastened with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws (*included*) that install with no pre-drilling and feature a corrosion-resistant double barrier coating.

CCQM – Intended for use along a floor support beam and non-corner locations.

CCTQM – Also for use along a floor support beam and non-corner locations with a side stirrup that accommodates intermediate support beams coming at 90 degrees.

CCCQM – For use along a floor support beam with a stirrup on each side of the main channel that accommodates intermediate support beams coming at 90 degrees.

ECCLQM-KT – Intended for use at the corners with MSTQM straps to make the connection from the ECCLQM to the wall framing above.

ECCL/RQMD-KT – Ideal for applications where a member is needed off the corner of the structure, such as a deck joist/beam.

MATERIAL: Column caps—7 gauge; strap (MSTQM)—12 gauge

FINISH: Column caps—Hot-dip galvanized or Simpson Strong-Tie® gray paint; strap (MSTQM) = galvanized (ZMAX®)

INSTALLATION: • Use all specified fasteners. See General Notes.

• Reference F-C-CCQM-WS special order worksheet for ordering assistance.

OPTIONS: • For variable widths on side stirrups specify W3 or W4 (3 1/4" to 7") and add an "X" to the end of the core model name.

Example: CCTQM5.50X-SDSG, W3 = 3 3/8".

CODES: See page 12 for Code Reference Key Chart.

1. The allowable loads have been increased for wind or earthquake loading with no further increase allowed.
2. Total uplift load and lateral load is based on tested anchor failure in the pier.
3. Allowable loads are based on either a 16" square grout-filled CMU pier with f'm of 1500 psi or a 16" square CMU shell filled with 3000 psi concrete. A minimum of (4) #7 vertical rebars are required. The Designer shall design and detail the CMU/concrete pier to resist all forces including uplift, shear, and moment.
4. Pier height per Designer.
5. Side beam and main beam uplift loads assume DF members and are not additive.

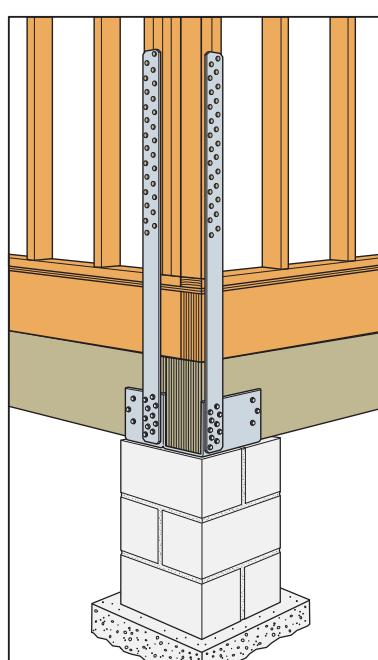

6. The allowable loads listed for grout-filled CMU apply to solid concrete piers of 2500 psi concrete a minimum of 16" square.
7. The allowable loads listed for CMU shell-filled with 3000 psi concrete apply to solid concrete piers of 3000 psi concrete a minimum of 12" square.
8. The ECCLQM-KT is a kit packaged with (2) MSTQM straps and (32) Strong-Drive 1/4"x2 1/2" SDS Heavy-Duty Connector screws. One strap may be installed on each face of the ECCLQM (as shown), using the Strong-Drive SDS Heavy-Duty Connector screws into the beams and 26-16dx2 1/2" nails (not provided) into the wall framing. The MSTQM strap's allowable tension load is 6240 lbs.
9. Any side stirrup not fully supported by grout or concrete filled CMU has an allowable down load of 7000 lbs.

(Plan View)16" Square CMU Pilaster Filled
with 3000 psi Concrete

16" Square Grout-Filled CMU

Straps are designed to transfer tension loads in a wide variety of applications.

HRS—A 12 gauge strap with a nailing pattern designed for installation on the edge of 2x members. The HRS416Z installs with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws.

LSTA and MSTA—Designed for use on the edge of 2x members, with a nailing pattern that reduces the potential for splitting.

LSTI—Light straps that are suitable where pneumatic-nailing is necessary through diaphragm decking and wood chord open web trusses.

MST—Splitting may be a problem with installations on lumber smaller than 3½", either fill every nail hole with 10dx1½" nails or fill every other hole with 16d common nails. Reduce the allowable load based upon the size and quantity of fasteners used.

MSTC—High Capacity strap which utilizes a staggered nail pattern to help minimize wood splitting. Nail slots have been countersunk to provide a lower nail head profile.

FINISH: PS—HDG; HST3 and HST6—Simpson Strong-Tie® gray paint; all others—galvanized. Some products are available in stainless steel or ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: Use all specified fasteners. See General Notes.

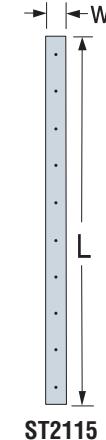

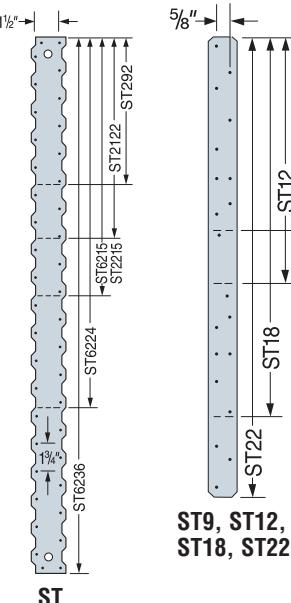

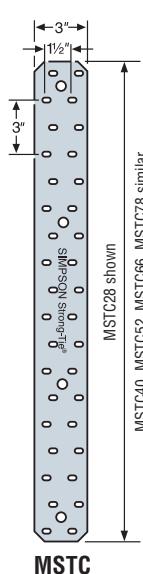

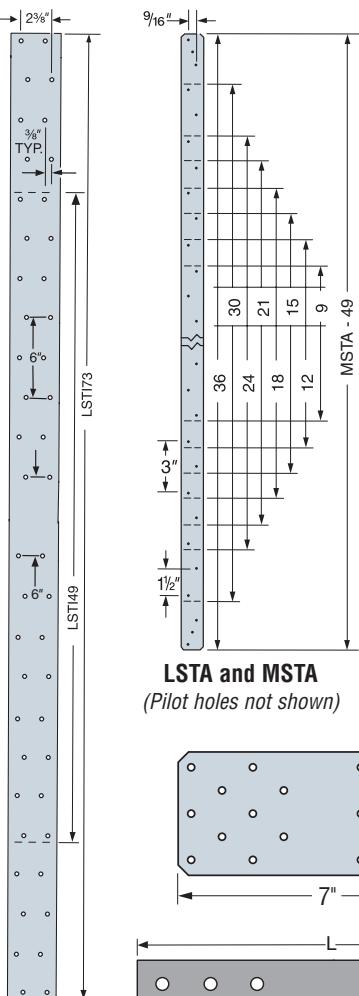

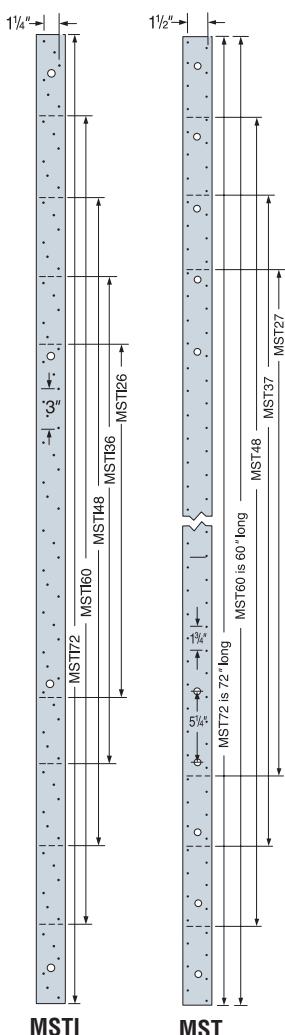

OPTIONS: Special sizes can be made to order. Contact Simpson Strong-Tie.

CODES: See page 12 for Code Reference Key Chart.

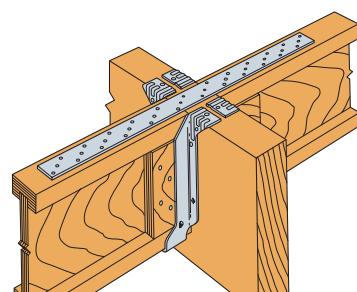

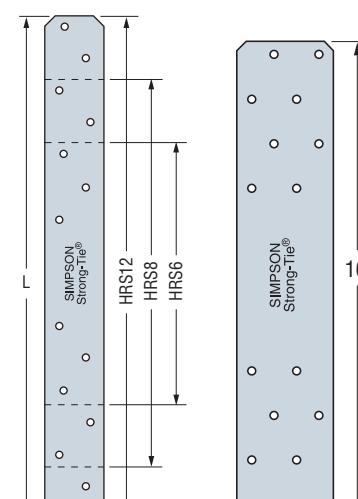

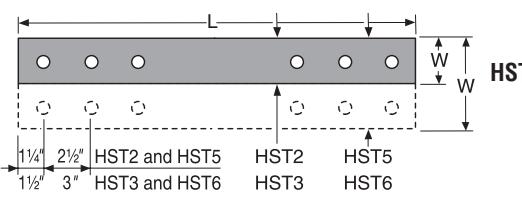

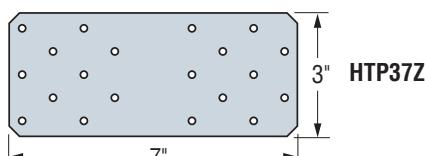

MSTC and RPS meet code requirements for reinforcing cut members (16 gauge) at top plate and RPS at sill plate. International Residential Code®—2000/2006 R602.6.1

International Building Code®—2000/2006 2308.9.8

- Loads include a 60% load duration increase on the fasteners for wind or earthquake loading.
- 10dx1 1/2" nails may be substituted where 16d sinkers or 10d are specified at 100% of the table loads except where straps are installed over sheathing.
- 10d commons may be substituted where 16d sinkers are specified at 100% of table loads.
- 16d sinkers (0.148" dia. x 3 1/4" long) or 10d commons may be substituted where 16d commons are specified at 0.84 of the table loads.
- Use half of the nails in each member being connected to achieve the listed loads.
- Tension loads apply for uplift when installed vertically.
- NAILS:** 16d = 0.162" dia. x 3 1/2" long, 16d Sinker = 0.148" dia. x 3 1/4" long, 10d = 0.148" dia. x 3" long. 10dx1 1/2" = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

Typical LSTA Installation
(Hanger not shown)
Bend strap one time only,
max 12/12 joist pitch.

Model No.	Material Thickness Gauge	Dim.		Bolts		Code Ref.
		W	L	Qty	Dia	
PS218		2	18	4	3/4	
PS418	7 ga	4	18	4	3/4	180
PS720		6 1/4	20	8	1/2	

- PS strap design loads must be determined by the Designer for each installation. Bolts are installed both perpendicular and parallel-to-grain. Hole diameter in the part may be oversized to accommodate the HDG. Designer must determine if the oversize creates an unacceptable installation.
- For allowable tension loads, see page 230.

Typical PS720 Installation

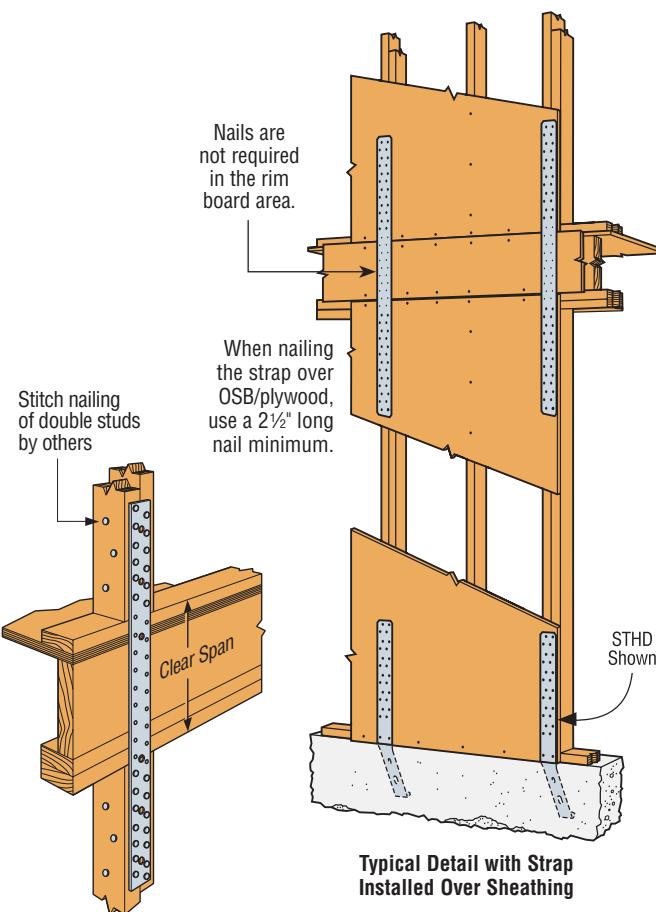

HST/MST/MSTC/MSTA Strap Ties

CODES: See page 12 for Code Reference Key Chart.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

HST6		6	25 1/2	—	12	3/4	—	15470	—	13320	

1. Loads include a 60% load duration increase on the fasteners for wind or earthquake loading.

2. Install bolts or nails as specified by Designer. Bolt and nail values may not be combined.

3. Allowable bolt loads are based on parallel-to-grain loading and these minimum member thicknesses: MST-2 1/2"; HST2 and HST5-4"; HST3 and HST6-4 1/4".

4. Use half of the required nails in each member being connected to achieve the listed loads.

5. When installing strap over wood structural panel sheathing, use 2 1/2" long nail minimum.

6. Tension loads apply for uplift as well when installed vertically.

7. NAILS: 16d = 0.162" dia. x 3 1/2" long, 16d Sinker = 0.148" dia. x 3 1/4" long,

10dx1 1/2" = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

CS/CMST Coiled Straps

CMSTC provides nail slots for easy installation; it can be cut to length. CS are continuous utility straps which can be cut to length on the job site. Packaged in lightweight (about 40 pounds) cartons.
FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page xx-xx.

INSTALLATION: • Use all specified fasteners. See General Notes.

- Wood shrinkage after strap installation across horizontal wood members may cause strap to buckle outward.
- Refer to the applicable code for minimum nail penetration and minimum wood edge and end distances.
- The table shows the maximum allowable loads and the nails required to obtain them. Fewer nails may be used; reduce the allowable load as shown in footnote #3.
- The cut length of the strap shall be equal to twice the "End Length" noted in the table plus the clear span dimension.
- CMST only—Use every other round hole if the wood tends to split. Use round and triangle holes for comparable MST loads, providing wood does not tend to split.
- For lap slice and alternate nailing information, refer to technical bulletin T-CMST.
- CS straps are available in 25' lengths, order CS14-R, CS16-R, CS18-R, CS20-R or CS22-R.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

Model No.	Total L	Ga	DF/SP		SPF/HF		Allowable Tension Loads (160)	Code Ref.
			Fasteners	End Length	Fasteners	End Length		
CMST12	40'	12	74 - 16d	33"	84 - 16d	38"	9215	I4, L3, F2

			14 - 8d	9"	16 - 8d	9"	1030	
CS22	300'	22	10 - 10d	7"	12 - 10d	7"	845	
			12 - 8d	7"	14 - 8d	8"	845	

1. Fastener quantities and end lengths are calculated using an increase for wind or seismic loading.

2. Use half of the required nails in each member being connected to achieve the listed loads.

3. Calculate the connector value for a reduced number of nails as follows: Allowable Load = $\frac{\text{No. of Nails Used}}{\text{No. of Nails in Table}} \times \text{Table Load}$

Example: CMSTC16 in DF/SP with 40 nails total.
 $(\text{Half of the nails in each member being connected})$ Allowable Load = $\frac{40 \text{ Nails (Used)}}{50 \text{ Nails (Table)}} \times 4585 \text{ lbs} = 3668 \text{ lbs}$

4. Tension loads apply for uplift when installed vertically.

5. **NAILS:** 16d = 0.162" dia. x 3½" long,

16d Sinker = 0.148" dia. x 3¼" long, 10d = 0.148" dia. x 3" long.

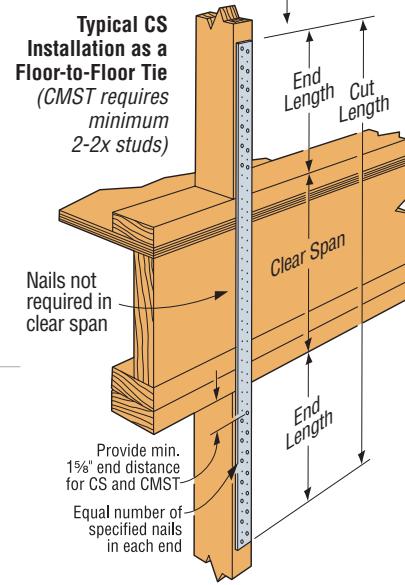

See pages 22-23 for other nail sizes and information.

NOT SURE HOW MUCH COIL STRAP YOU NEED?

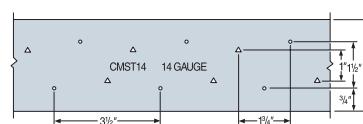

Simpson Strong-Tie has a web-based app, the Coil Strap Length Calculator, which can help you quickly determine the cut length of each strap and the total amount of coil strap needed for each application on a project.

For more information or to access, go to www.strongtie.com/software.

Typical Horizontal CS/CMST Installation

TS Twist Straps

Twist straps provide a tension connection between two wood members. An equal number of right and left hand units are supplied in each carton.

MATERIAL: 16 gauge.

FINISH: Galvanized. See Corrosion Information, pages 13-15.

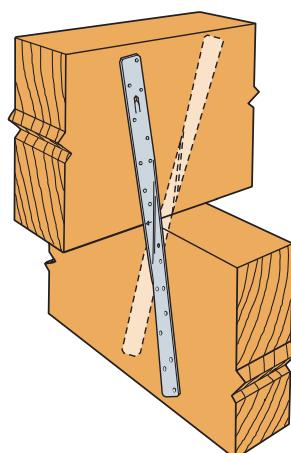

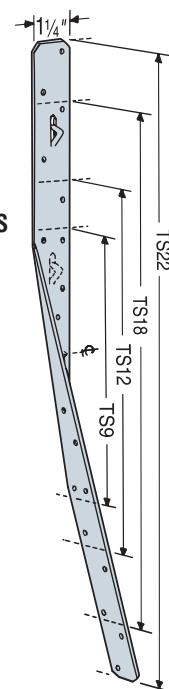

INSTALLATION: • Use all specified fasteners. See General Notes.

- TS should be installed in pairs to reduce eccentricity.

CODES: See page 12 for Code Reference Key Chart.

Model No.	L	Fasteners (Total)	Allowable Loads (160)	Code Ref.
TS9	9	8-16d	530	170
TS12	11½	10-16d	665	
TS18	17¼	14-16d	930	
TS22	21½	18-16d	1215	

1. Install half of the fasteners on each end of the strap to achieve full loads.
2. Loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
3. 16d sinkers (0.148" dia. x 3¼") may be substituted for the specified 16d commons at 0.84 of the table loads.
4. Loads are for a single TS.
5. **NAILS:** 16d = 0.162" dia. x 3½" long.
See pages 22-23 for other nail sizes and information.

Typical TS Installation

SA Strap Connectors

A seismic tie for horizontal ties across intervening members.

FINISH: Galvanized

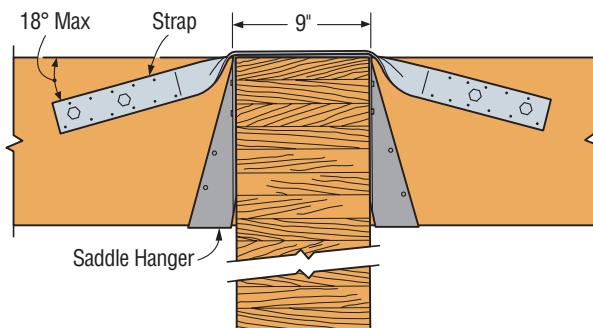

INSTALLATION:

- Use all specified fasteners. See General Notes.
- May not be suitable for floor diaphragms which protrude above beams.
- SA36 can be field-bent for other intermediate beam widths.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Strap Section	L	Fasteners (Total)		Allowable Horizontal Loads		Code Ref.	
			Nails	Bolts		Nails (160)	Bolts (160)	
				Qty.	Dia.			
SA36	12 ga x 2½ ¹⁶	36	22-16d	4	½	1900	1900	I15, L7

1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. Allowable loads assume a restrained member of 3½" min. thickness with bolts in single shear.
3. Bolt and nail values may not be combined.
4. **NAILS:** 16d = 0.162" dia. x 3½" long.
See pages 22-23 for other nail sizes and information.

Typical SA Installation with Saddle Hanger

STRONG-DRIVE® SDWF FLOOR-TO-FLOOR Screw

The Simpson Strong-Tie® Strong-Drive® SDWF Floor-to-Floor screw is designed to simplify the floor-to-floor, wind-uplift restraint connection while providing superior performance over the life of the structure. The unique design of the Strong-Drive SDWF Floor-to-Floor screw enables it to attach upper and lower walls together from the top, spanning the floor system and providing an easy-to-install connection within the continuous uplift load path of the structure.

The innovative TUW take-up washer plays a key role in the long-term performance of the Strong-Drive SDWF Floor-to-Floor screw when installed between the screw and the sole plate of the upper floor. As the structure settles because of shrinkage and construction loading, the threaded portion under the head of the screw ratchets up through the tabs of the TUW, which is fastened with Strong-Drive SD Connector screws. The interlock between the tabs of the take-up washer and the threads under the head of the Strong-Drive SDWF Floor-to-Floor screw prevent the screw from sliding back under load, providing a simple yet reliable means of shrinkage compensation up to $\frac{3}{4}$ " per story.

MATERIAL: SDWF – carbon steel, TUW – 10 gauge

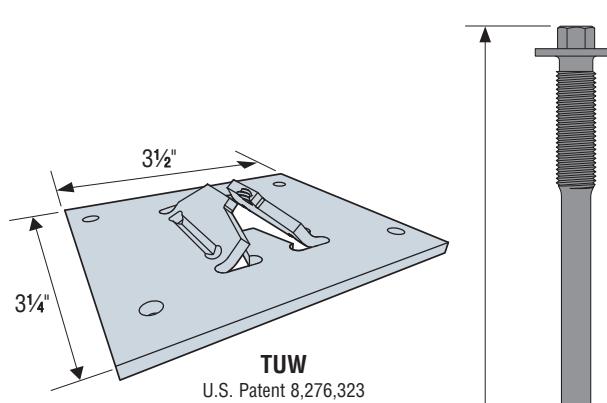

FINISH: SDWF—E-Coat™; TUW—Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- Refer to flier F-SDWFTUW, or the **Simpson Strong-Tie® Systems catalog** or visit www.strongtie.com.

KIT CONTAINS: 25—Strong-Drive SDWF Floor-to-Floor screws, 25—TUW take-up washers, 100—#9x2½ Strong-Drive SD Connector screws, $\frac{5}{16}$ " hex driver bit and screw depth guide.

CODES: See page 12 for Code Reference Key Chart.

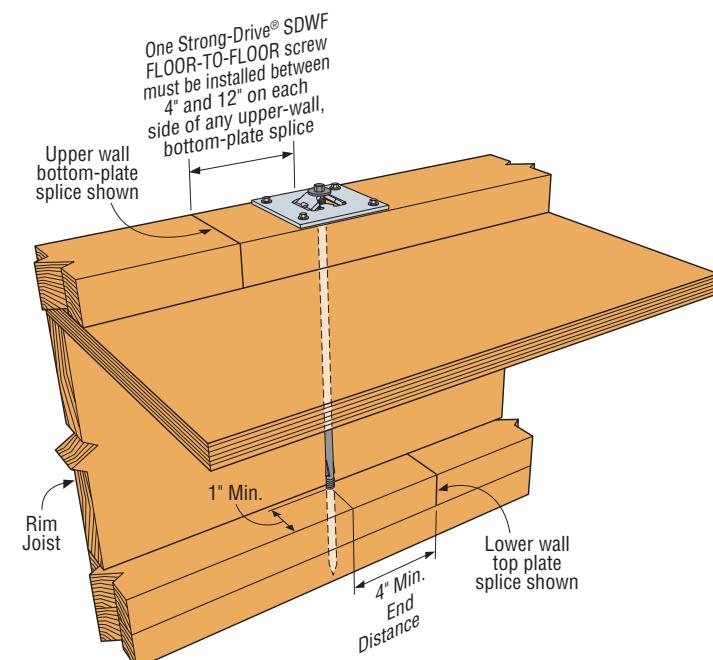

Product Information and Withdrawal Loads

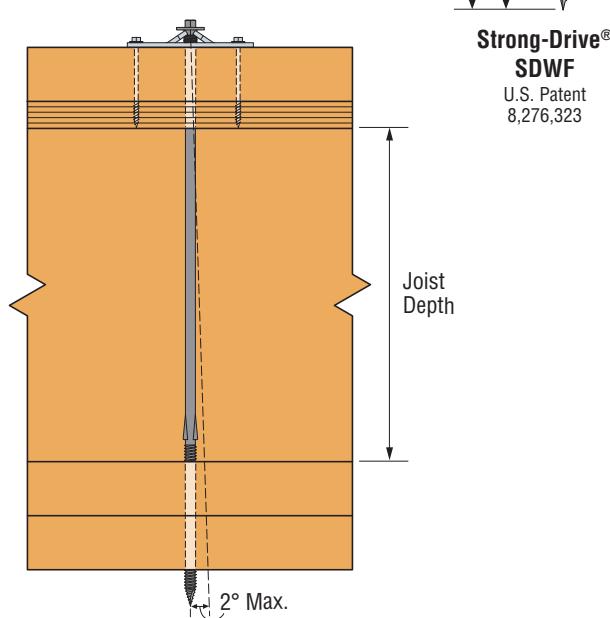

Model No	Size (in.)	Thread Length (in.)	Allowable Joist Depth Below (in.)				Allowable Withdrawal per Thread Penetration (lbs./in.) (100)			Code Ref.
			Single Bottom Plate		Double Bottom Plate		SP	DF	SPF	
			Min.	Max.	Min.	Max.				
SDWF2716-TUW	0.27 x 16	5	8½	10½	6¾	9	295	250	180	I24, I26, F31, L24
SDWF2720-TUW	0.27 x 20	5	12½	14½	10½	13

SPF	52	46	42	38	34	30	26	22	20	18	16

1. Spacing listed based on lesser of: single bottom plate bending allowable load, single bottom plate deflection limited to spacing/240 and $\frac{1}{4}$ " max, screw allowable withdrawal load, and take-up washer allowable load.
2. Withdrawal load is based on a $C_D = 1.6$ and minimum 3" penetration into lower wall double top plates.
3. Stud-to-plate connections are required to complete the load path. These connections shall not exceed the lesser of 48" o.c. or Strong-Drive SDWF Floor-To-Floor spacing.
4. Spacing values listed for SP lumber consider new base values adopted by AWC on June 1, 2013.

Concentrated Uplift Loads

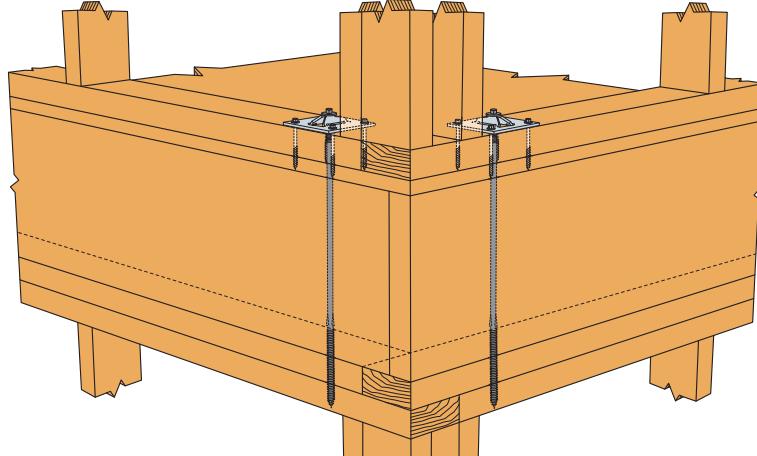

Model No	Single Strong-Drive SDWF-TUW			Double Strong-Drive SDWF-TUW				
	Allowable Tension Load (160)			Deflection at Highest Allowable Load (in.)	Allowable Tension Load (160)			
	SP	DF	SPF		SP	DF		
SDWF2716-TUW	1410	1200	865	0.095	2270	2125	1730	0.142
SDWF2720-TUW								
SDWF2724-TUW								
SDWF2726-TUW								

1. Allowable loads listed include a wood load duration factor of $C_D = 1.6$ for wind or earthquake loading with no further increase allowed.
2. Single and double Strong-Drive SDWF-TUW applications listed are for concentrated load uplift restraint conditions (i.e. end of header, at girders, or at the end of shearwalls).

Double Strong-Drive SDWF-TUW Concentrated Load Restraint Detail at Continuous Wall
(Single Strong-Drive SDWF-TUW similar)

Note: Stud-to-plate connections are required to complete the load path and are the responsibility of the Designer.

(Single Strong-Drive SDWF-TUW similar)

FSC Floor Span Connector

As an alternative to coil strap, our new FSC-Floor Span Connector connects upper floors to lower floors from the inside of the wall. The convenient obround holes make installation in narrow wall cavities easy. Installs with a $\frac{3}{8}$ " all thread rod, nut and washer (*not included*).

MATERIAL: See table

FINISH: Galvanized

INSTALLATION:

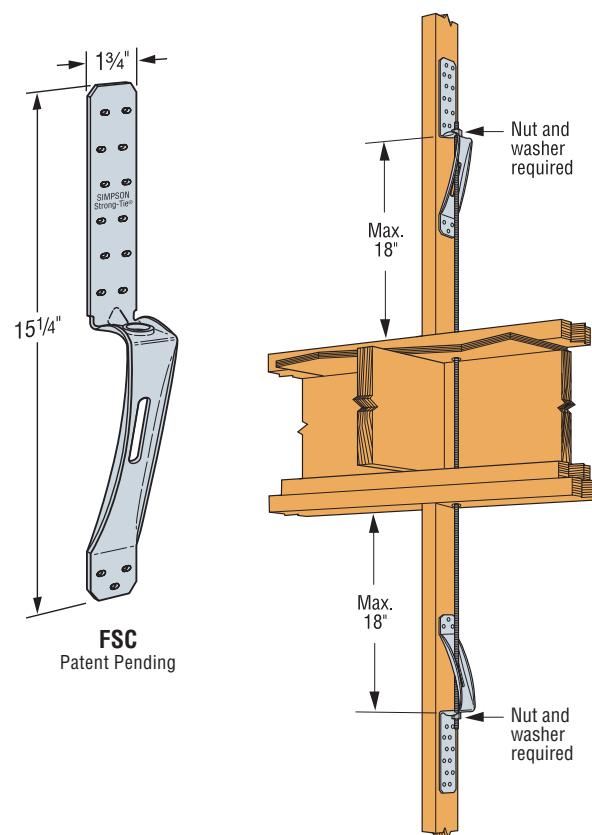

- Can be used on a single 2x stud.
- Threaded rod, washers and nuts are not supplied with the FSC.
- Use $\frac{3}{8}$ " threaded rod grade A307 or better, with matching nuts and cut washers.
- FSC may be installed a maximum of 18" from the sill or top plates.
- Drill $\frac{1}{2}$ " to $\frac{3}{4}$ " diameter hole through the plates for threaded rod access, hole should be located approximately $1\frac{1}{2}$ " away from the face of stud used for FSC attachment.
- Nails can be installed up to 30 degree angle with no reduction in load capacity.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Ga	Fasteners		Allowable Tension Load		Code Ref.
		Stud	Anchor	DF/SP	SPF/HF	
				(160)	(160)	
FSC	12	15-10dx1 $\frac{1}{2}$	$\frac{3}{8}$ " ATR	1830	1570	IP1, L18, F25

1. The allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
2. Load values are based on a minimum lumber thickness of $1\frac{1}{2}$ ".
3. Standard cut washer is required with the $\frac{3}{8}$ " all thread rod.
4. The FSC can be used on offset studs provided the horizontal offset is no greater than 3". Refer to flier F-FSC for more information.
5. **NAILS:** $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long.

See pages 22-23 for other nail sizes and information.

Typical FSC Installation

MSTC48B3/MSTC66B3 Pre-Bent Straps

The MSTC48B3 and MSTC66B3 are pre-bent straps designed to transfer tension load from an upper story shearwall to a beam on the story below.

MATERIAL: 14 gauge

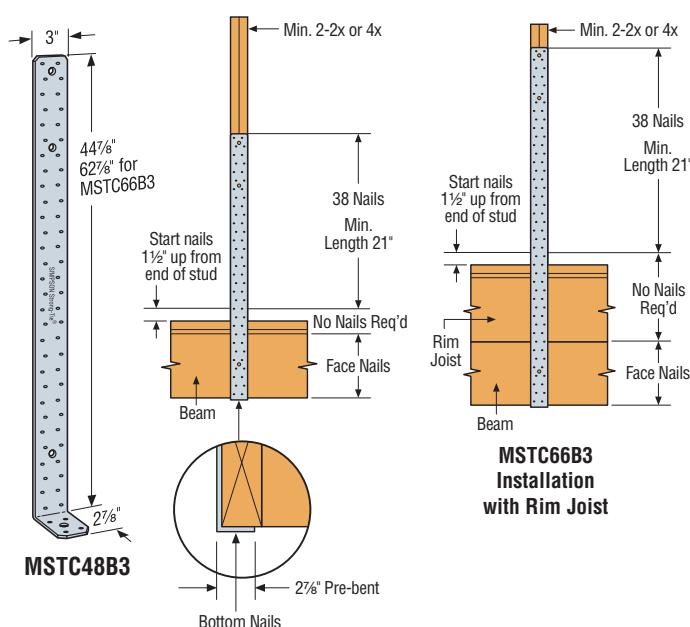

FINISH: Galvanized. Contact Simpson Strong-Tie.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Min. Wood Beam Dim.		Fasteners		Allowable Tension Loads		Code Ref.	
	Width (min)	Depth (min)	Beam		Studs/Post	DF/SP	SPF/HF	
			Face	Bottom		(160)	(160)	
MSTC48B3	3	9 1/4	12-10d	4-10d	38-10d	3975	3420	I4, F26
MSTC66B3	3 1/2	11 1/4	14-10d			4505	3875	

1. Using fewer than 38 nails in the studs/post will reduce the capacity of the connection. To calculate a reduced capacity use 199 lbs. per nail for DF/SP or 172 lbs. per nail for HF/SPF. Minimum length of extent of reduced nails may not be less than a 21" as is shown in graphic.
2. Nails in studs/post shall be installed symmetrically. Nails may be installed over the entire length of the strap over the studs/post.
3. The minimum 3" wide beam may be made up by double 2x members.
4. MSTC48B3 and MSTC66B3 installed over wood structural panel sheathing up to $\frac{1}{2}$ " thick achieve 0.85 of table loads.
5. PSL beam may be used in lieu of standard dimension lumber beam with no load reductions.
6. Multiply allowable loads by 1.85 to attain an allowable load for installations where two straps have been installed with a $1\frac{1}{2}$ " clear space between straps.
7. Structural composite lumber columns have sides that either show the wide face or the edges of the lumber strands/veneers known as the narrow face. Values in the tables reflect installation into the wide face. See Technical Bulletin T-C-SCLCLM for load reductions due to narrow face installations.
8. **NAILS:** $10d = 0.148$ " dia. x 3" long. See pages 22-23 for other nail sizes and information.

MSTC66B3
Installation with
Rim Joist

FTA/LFTA Floor Tie Anchors

Designed for use as a floor-to-floor tension tie, one FTA replaces two comparably sized holdowns and the threaded rod.

The LFTA Light Floor Tie Anchor is for nailed installations.

MATERIAL: See table

FINISH: LFTA—galvanized;

FTA—Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners.

See General Notes.

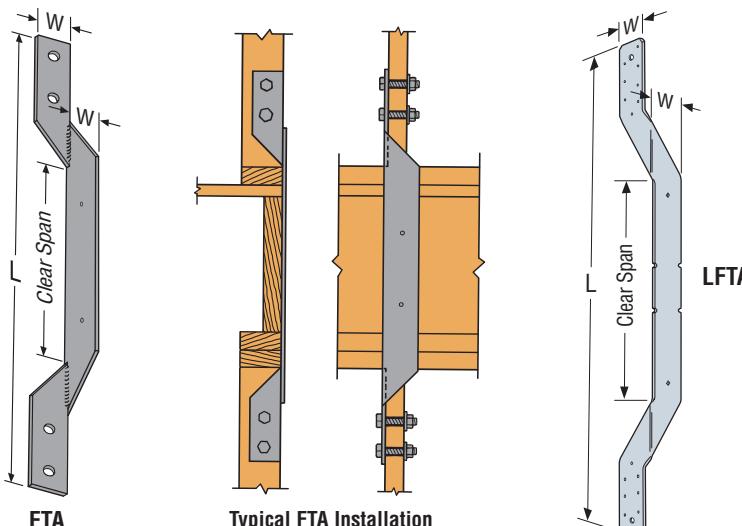

- Washers required on side opposite FTA for full loads.

- Nail holes between floors allow preattachment to the joist during installation; these nails are not required.

OPTIONS:

- The standard model's clear span of 17" will accommodate up to a 12" joist. The clear span of the FTA may be increased with a corresponding increase in overall length.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Ga	Dimensions			Fasteners (Total)		Allowable Uplift Loads ¹ (160)					Code Ref.
		W	Clear Span	L	Qty	Dia	1½	2	2½	3	3½	
LFTA	16	2½	17	38½	16-10d	—	—	—	—	—	—	1205
FTA2	10	3	17	37½	4	⅜	1890	2515	3120	3385	3385	—
FTA5	10	3½	17	45½	4	⅜	2240	3000	3750	4400	4400	—
FTA7	3	3½	17	56	6	⅜	3715	5020	6210	7600	7600	—

1. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.

2. Reduce the allowable load for the LFTA according to the code when nails penetrate wood less than 1¾".

3. **NAILS:** 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

T and L Strap Ties

T and L Strap Ties are versatile utility straps. See Architectural Products Group for aesthetically pleasing options with black powder-coated paint.

FINISH: Galvanized. See Corrosion Information, pages 13-15.

CODES: See page 12 for Code Listing Key Chart.

Model No.	Ga	Dimensions			Fasteners		Code Ref.	
		L	H	W	Nails			
					Qty	Dia

1616HL	7	2½	16	16	2½	4¾	5	⅜	1535	565	
1212HT	7	2½	12	12	2½	4¾	6	⅜	2585	815	
1616HT	7	2½	16	16	2½	4¾	6	⅜	2585	815	

1. 1212HL, 1616HL, 1212HT and 1616HT are to be installed in pairs with machine bolts in double shear. A single part with machine bolts in single shear is not load-rated.

2. Allowable loads are based on a minimum member thickness of 3½".

3. 1212HT, 1616HT loads assume a continuous beam.

PCT Purlin Cross Ties

Designed using a section that works in both tension and compression.

MATERIAL: 1½" square tube steel

ASTM A500 Grade B

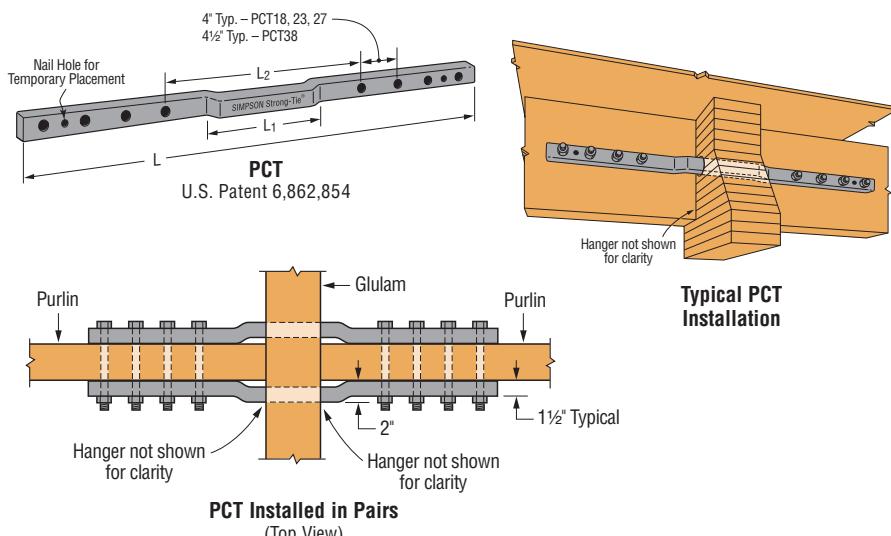

FINISH: Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners. See General Notes.

- PCT18 and 23 are sized to span a maximum hanger seat depth ("B" dimension) of 4".
- PCT27 and 38 are sized to span a maximum hanger seat depth ("B" dimension) of 6".
- Tube section helps with drilling alignment, through the purlin.
- Offset angle to allow drilling access through glulam.
- 2½" or a 2½" diameter hole required **for the PCT to pass through the carrying member.**
- Install in pairs.

OPTIONS: Contact Simpson Strong-Tie for other lengths.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Tube Thickness	Total Length L	L ₁	L ₂	No. and Size of Fasteners	Allowable Loads per Pair of PCTs						Code Ref.

1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. Install in pairs.

3. Minimum bolt length is (Purlin width + 3") (PCT) + 1" (nut).

4. Bolt value assume minimum 10½" deep purlin.

5. Engineer of record is responsible for evaluating the glulam.

HCSTR Hinge Connector Straps

Use Hinge Connector Straps for retrofit applications to strap horizontal wood members together where a hinge connector interferes.

All bolt holes shall be ½" (minimum) and ¾" (maximum) larger than the bolt diameter ([2012 NDS 11.1.3.2](#)).

MATERIAL: HCSTR2, HCSTR3—7 gauge; HCSTR4—3 gauge

FINISH: HCSTR4—Simpson Strong-Tie® gray paint.

All others—Galvanized

OPTIONS:

- Contact Simpson Strong-Tie for longer lengths.
- For use with Simpson Strong-Tie hinge connectors.

CODES: See page 12 for Code Reference Key Chart.

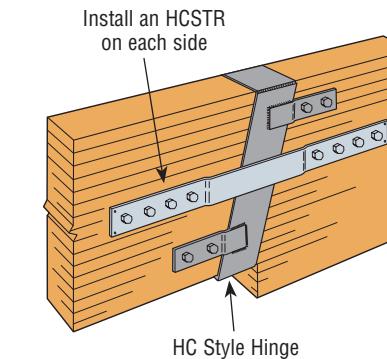

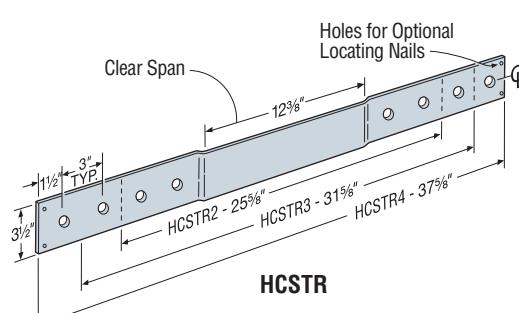

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Fasteners (Total)		Allowable Loads (160)	Code Ref.
	Qty	Dia		
HCSTR2	4	¾"	9725	170
HCSTR3	6	¾"	14170	
HCSTR4	8	¾"	18770	

1. Allowable loads are for straps used in pairs and include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. Allowable loads assume a carrying member of 5½" minimum thickness with bolts in double shear.

3. Designed for HC style hinge connectors; contact Simpson Strong-Tie for lengths for HCA and HC3A (only) style hinge connectors.

Typical HCSTR4 Installation

H/TSP Seismic & Hurricane Ties

Simpson Strong-Tie® hurricane ties provide a positive connection between truss/rafter and the wall of the structure to resist wind and seismic forces. New additions to the line provide even more options.

- H10AR – The heavy-duty design of the H10A available with a 2" wide throat to accommodate rough lumber
- H10A-2 – The H10A design with a 3" throat for double 2x members
- H2ASS, H2.5ASS and H10ASS – Popular ties now available in stainless steel.

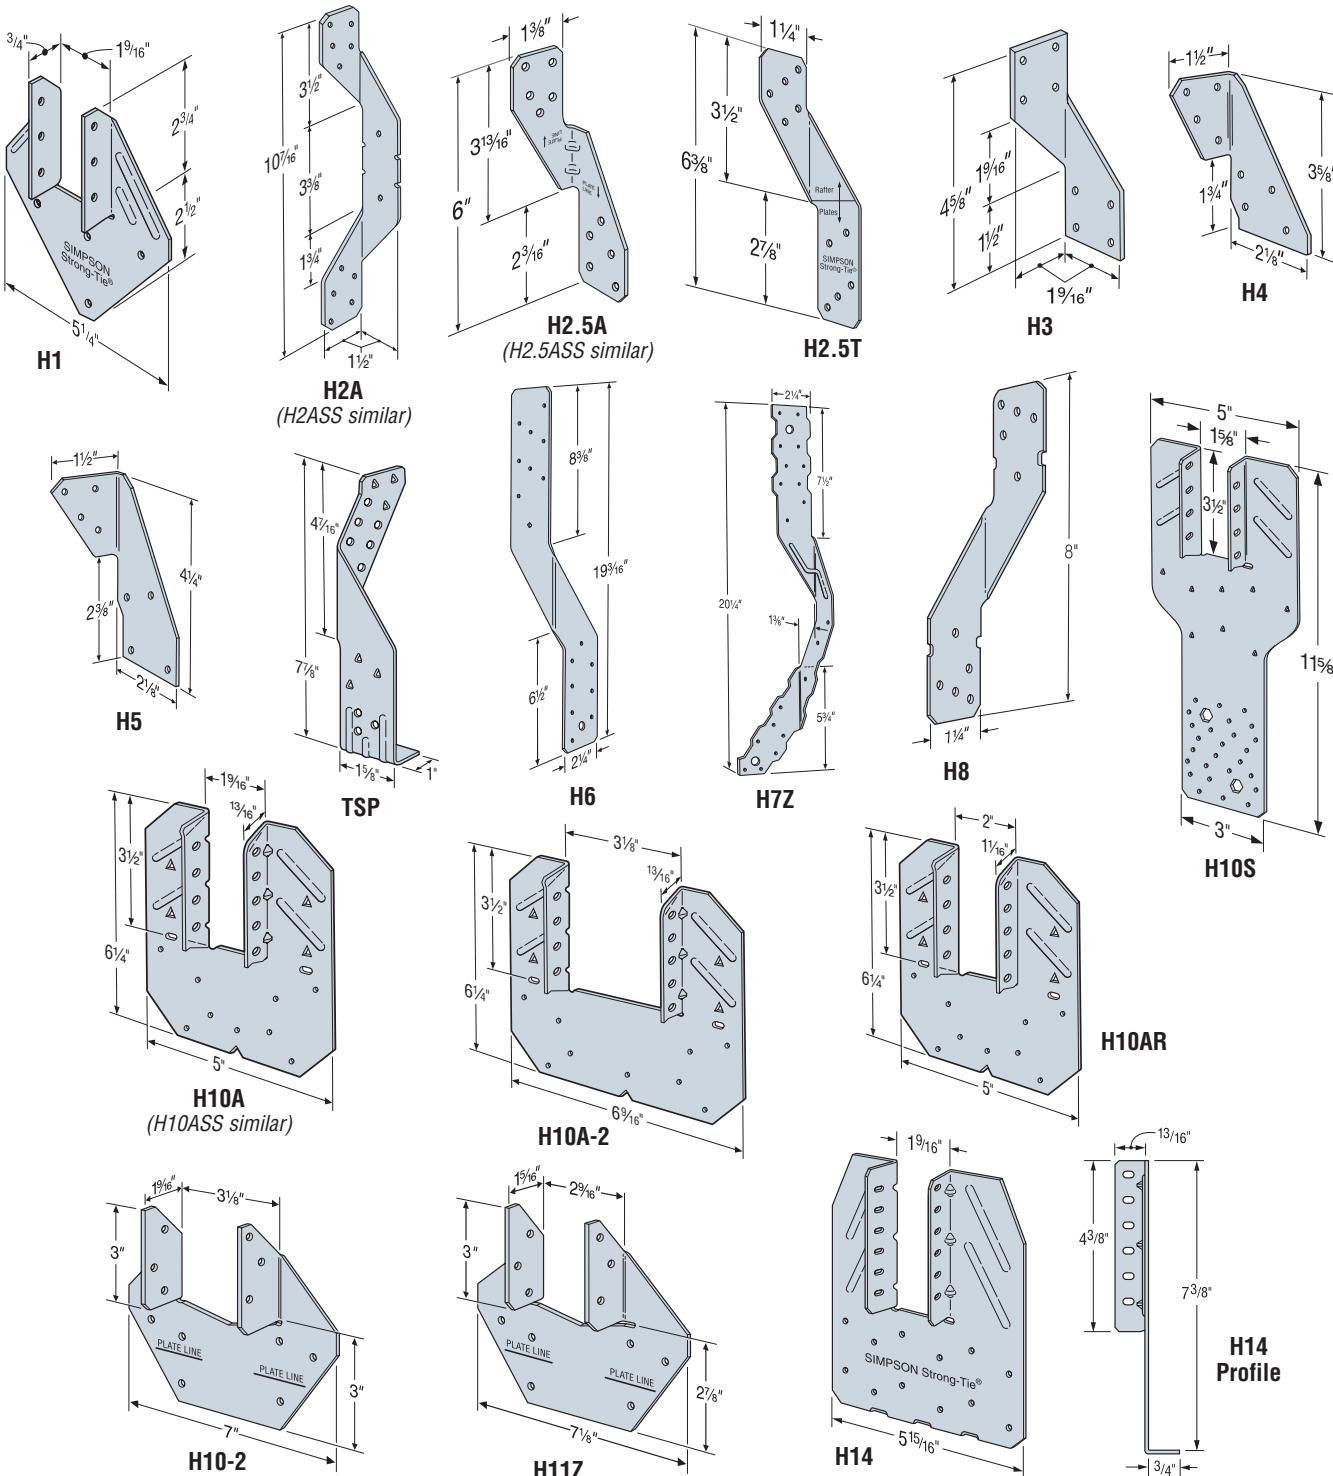

MATERIAL: See table.

FINISH: Galvanized. H7Z and H11Z—ZMAX® coating. Some models available in stainless steel or ZMAX; see Corrosion Information, pages 13-15 or visit www.strongtie.com.

INSTALLATION: • Use all specified fasteners. See General Notes.

- H1 can be installed with flanges facing inward (*reverse of H1 installation drawing; number 1*).
- H2.5T, H3, H4, H5 and H6 ties are shipped in equal quantities of right and left versions (*right versions shown*).
- Hurricane ties do not replace solid blocking.
- When installing ties on plated trusses (*on the side opposite the truss plate*) do not fasten through the truss plate from behind. This can force the truss plate off of the truss and compromise truss performance.
- H10A optional nailing to connect shear blocking, use 8d nails. Slots allow maximum field bending up to a pitch of 6:12, use H10A sloped loads for field bent installation.

CODES: See page 12 for Code Reference Key Chart.

H/TSP Seismic & Hurricane Ties

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

1. Loads have been increased for wind or earthquake loading with no further increase allowed: reduce where other loads govern.
2. Allowable loads are for one anchor. A minimum rafter thickness of 2½" must be used when framing anchors are used on each side of the joist and on the same side of the plate (*exemption: connectors installed such that nails on opposite side don't interfere*).
3. Allowable DF/SP uplift load for stud to bottom plate installation (*see detail 15*) is 390 lbs. (H2.5A); 265 lbs. (H2.5ASS); 360 lbs. (H4) and 310 lbs. (H8). For SPF/HF values multiply these values by 0.86.
4. Allowable loads in the F₁ direction are not intended to replace diaphragm boundary members or cross grain bending of the truss or rafter members.
5. When cross-grain bending or cross-grain tension cannot be avoided in the members, mechanical reinforcement to resist such forces may be considered.
6. Hurricane Ties are shown on the outside of the wall for clarity and assume a minimum overhang of 3½". Installation on the inside of the wall is acceptable (*see General Instructions for the Installer notes u on page 17*). For uplift

Continuous Load Path, connections in the same area (*i.e. truss to plate connector and plate to stud connector*) must be on the same side of the wall. [See T-HTIECOMPATH for more information](#).

7. Southern Pine allowable uplift loads for H10A = 1340 lbs. and for the H14 = 1465 lbs.

8. Refer to Simpson Strong-Tie® technical bulletin T-HTIEBEARING for allowable bearing enhancement loads.

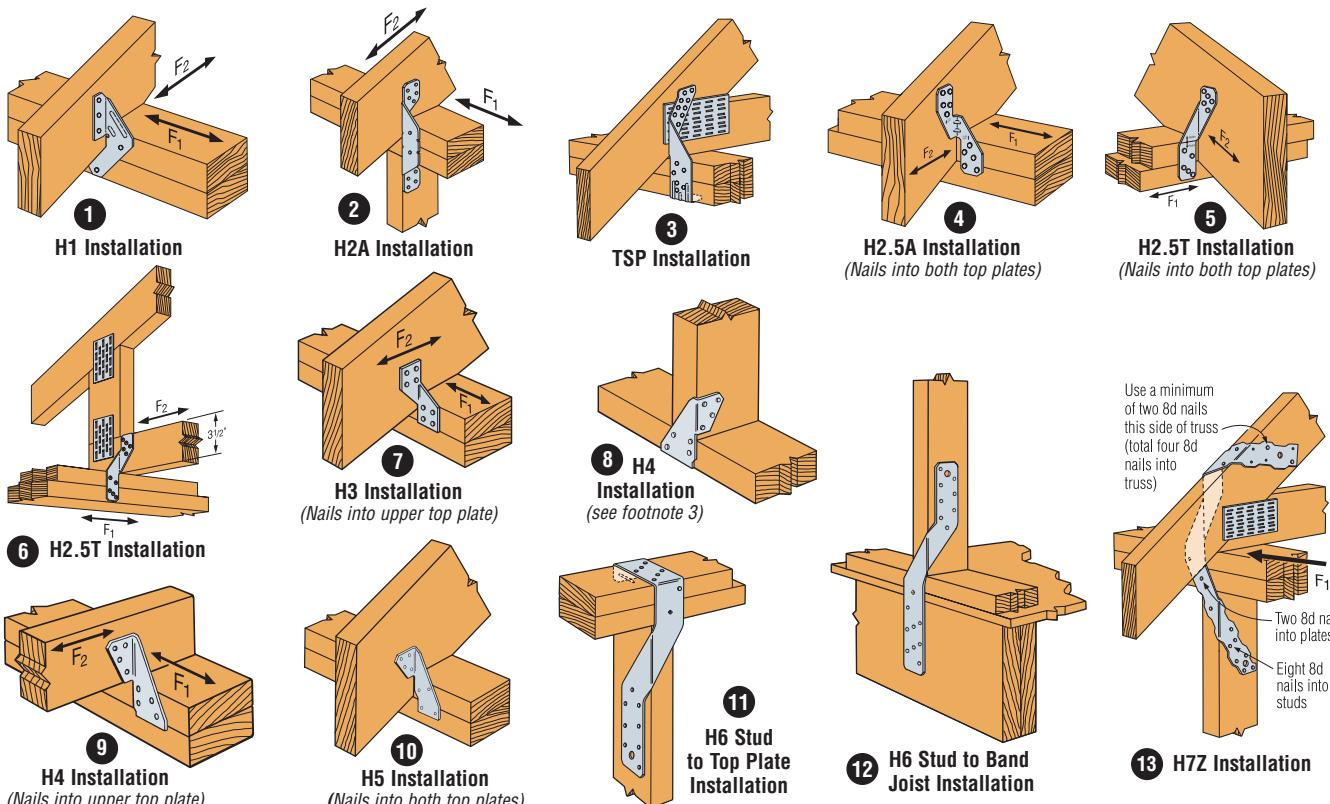

9. H10S has the stud offset a maximum of 1" from rafter (*center to center*) for a reduced uplift of 890 lbs. (DF/SP) and 765 lbs. (SPF).

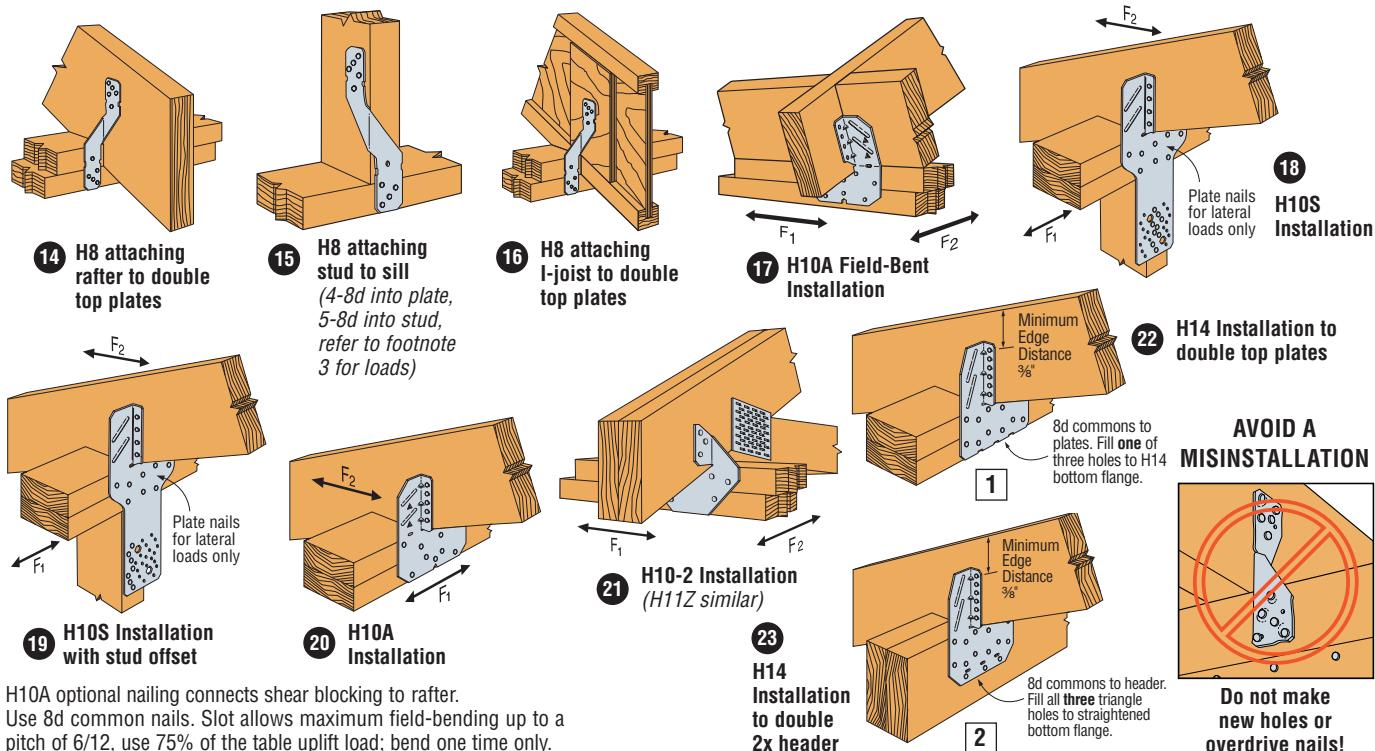

10. H10S nails to plates are optional for uplift but required for lateral loads.

11. Some load values for the stainless-steel connectors shown here are lower than those for the carbon-steel versions. Ongoing test programs have shown this to also be the case with other stainless-steel connectors in the product line that are installed with nails. Visit [www.strongtie.com/corrosion](#) for updated information.

12. **NAILS:** 16dx2½ = 0.162" dia. x 2½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long, 8d = 0.131" dia. x 2½" long, 8dx1½ = 0.131" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

13. **SCREWS:** Strong-Drive® SD #9x1½" (model SD9112) = 0.131" dia. x 1½" long (*for the models marked with the orange flag only*). Full table loads apply.

H/TSP Seismic & Hurricane Ties

H10A optional nailing connects shear blocking to rafter.
Use 8d common nails. Slot allows maximum field-bending up to a pitch of 6/12, use 75% of the table uplift load; bend one time only.

Considerations for Hurricane Tie Selection

1. What is the uplift load?
2. What is the parallel-to-plate load?
3. What is the perpendicular-to-plate load?
4. What is the species of wood used for the rafter and the top plates? (Select the load table based on the lowest performing species of wood.)
5. Will the hurricane tie be nailed into both top plates or the upper top plate only?
6. What load or loads will the hurricane tie be taking?

When a connector is loaded simultaneously in more than one direction, the allowable load must be evaluated as shown here. For all connectors use the following equation:

$$\text{Design Uplift/Allowable Uplift} + \text{Design Lateral Parallel to Plate / Allowable Lateral Parallel to Plate} + \text{Design Lateral Perpendicular to Plate / Allowable Lateral Perpendicular to Plate} < 1.0.$$

The three terms in the unity equation are due to the possible directions that exist to generate force on a connector. The number of terms that must be considered for simultaneous loading is at the sole discretion of the Designer and is dependent on their method of calculating wind forces and the utilization of the connector within the structural system.

As an alternate, certain roof to wall connectors (*embedded truss anchors, pages 180-181, seismic and hurricane ties, pages 196-198, and twist straps, pages 202-203*) can be evaluated using the following: The design load in each direction shall not exceed the published allowable load in that direction multiplied by 0.75.

7. Select hurricane tie based on performance, application, installed cost and ease of installation.

VB Knee Braces

The VB provides lateral resistance force at the bottom of beams when installed approximately 45° or more to the vertical plane.

MATERIAL: 12 gauge **FINISH:** Galvanized

INSTALLATION: • Use specified fasteners. See General Notes.

- 16-N54A fasteners are included with the brace.

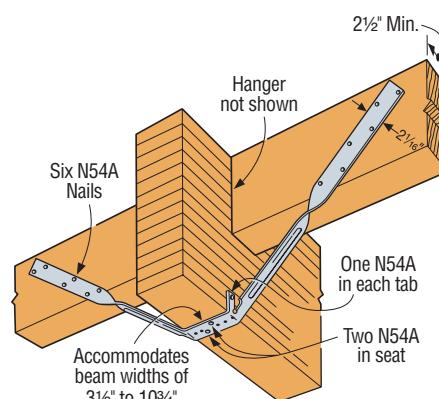

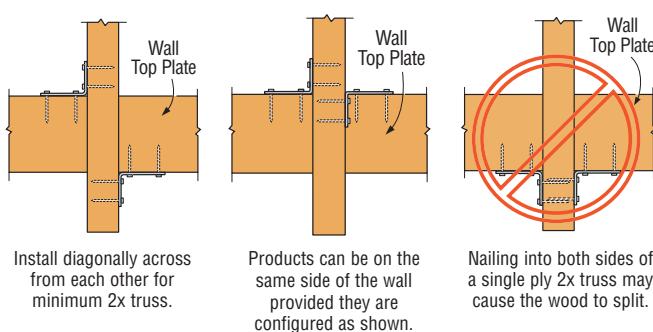

CODES: See page 12 for Code Reference Key Chart.

Model No.	H (Beam Depth)	L	Fasteners (Total)	Allowable Tension Loads ¹		Code Ref.
				Floor (100)	Roof (125)	
VB5	10" - 15"	5'	16-N54A	990	1240	
VB7	15" - 22½"	7'	16-N54A	990	1240	
VB8	22½" - 28½"	8'	16-N54A	990	1240	
VB10	28½" - 36"	10'	16-N54A	990	1240	
VB12	36" - 42"	12'	16-N54A	990	1240	

¹ Roof loads have been increased 25% with no further increase allowed.

Hurricane Tie Installations to Achieve Twice the Load (Top View)

Both connectors shall be same model.

Typical VB Installation

STRONG-DRIVE® SDWC TRUSS Screws

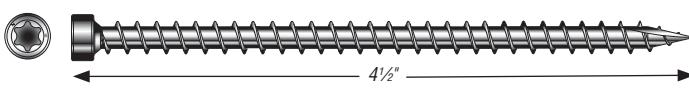

The Strong-Drive SDWC Truss Screw is tested in accordance with ICC-ES AC233 (screw) and AC13 (wall assembly and roof-to-wall assembly) for uplift and lateral loads between wall plates and vertical wall framing and between the top plate and the roof rafters or trusses. Strong-Drive SDWC15450 is recognized for use in chemically treated wood as described in the evaluation report.

MATERIAL: Carbon steel

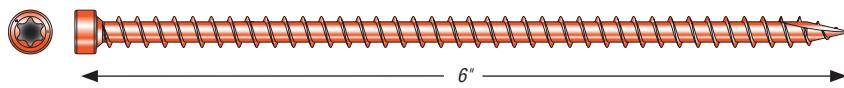

FINISH: SDWC15450—E-Coat™; SDWC15600—Clear Zinc Coating (with Orange Topcoat)

INSTALLATION: • See General Notes.

CODES: IAPMO-UES ER-262

Strong-Drive SDWC15450

Strong-Drive SDWC15600

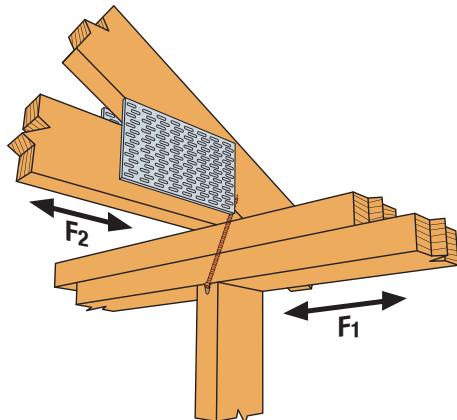

Strong-Drive® SDWC TRUSS Screw Allowable Roof-to-Wall Connection Loads – DFL, SP, SPF, HF¹⁻⁸

Model No.	Minor Diameter (in.)	Length (in.)	Thread Length (in.)	Allowable Loads						Code Ref.	
				DF/SP			SPF/HF				
				Uplift	F ₁	F ₂	Uplift	F ₁	F ₂		
SDWC15600	0.152	6	5 1/4	615	130	225	485	115	192	IP5, F14	

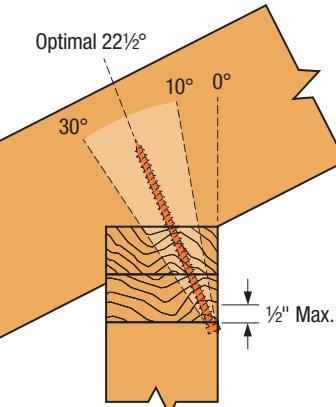

1. Loads have been increased for wind and earthquake ($C_D = 1.6$); no further increases allowed. Reduce when other loads govern.
2. Allowable loads are for an Strong-Drive SDWC Truss screw installed per the 'Recommended' or 'Optional' installation instructions. The Strong-Drive SDWC Truss screw is to be installed through a double 2x top plate into a minimum 2x4 truss or rafter.
3. An Strong-Drive SDWC Truss screw may be used in each ply of 2- or 3-ply rafters or trusses. The allowable uplift load for each screw shall be multiplied by 0.90, but may be limited by the capacity of the plate or the connection between the top plate to the framing below. Strong-Drive SDWC Truss screws in multi-ply assemblies must be spaced a minimum of 1 1/2" o.c.

4. Screws are shown installed on the interior side of the wall. Installations on the exterior side of the wall are acceptable when the rafter or truss overhangs the top plates a minimum of 3 1/2".
5. For Uplift Continuous Load Path, top plate to stud connectors such as the H2.5A, TSP or MTS12 must be located on the same side of the wall as the screw.
6. When the screw is loaded simultaneously in more than one direction, the allowable load must be evaluated using the following unity equation: $(\text{Design Uplift} \div \text{Allowable Uplift}) + (\text{Design } F_1 \div \text{Allowable } F_1) + (\text{Design } F_2 \div \text{Allowable } F_2) \leq 1.0$.
7. Table loads do not apply to trusses with end-grain bearing.
8. Top plate, stud and top plate splice fastened per applicable Building Code.

H Seismic & Hurricane Ties

The hurricane tie series features various configurations of wind and seismic ties for trusses and rafters.

The H16 series has a presloped seat of 5/12 for double trusses.

The presloped 5/12 seat of the H16 provides for a tight fit and reduced deflection. The strap length provides for various truss height up to a maximum of 13 1/2" (H16 series). Minimum heel height for H16 series is 4".

The HGA10 attaches to gable trusses and provides good lateral wind resistance. The HS24 attaches the bottom chord of a truss or rafter at pitches from 0/12 to 4/12 to double 2x4 top plates. Double shear nailing allows for higher lateral resistance.

MATERIAL: See table

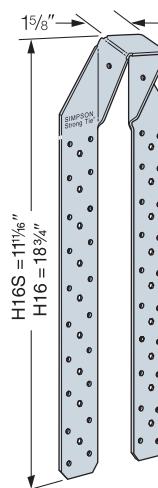

FINISH: Galvanized. See Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

- HGA10KT: sold as a kit with (10) HGA10 connectors. Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws are included.

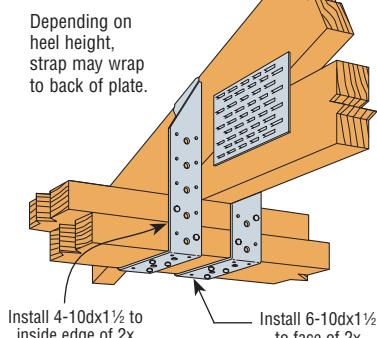

- HS24 requires slant nailing only when bottom chord of truss or rafter has no slope.

CODES: See page 12 for Code Reference Key Chart.

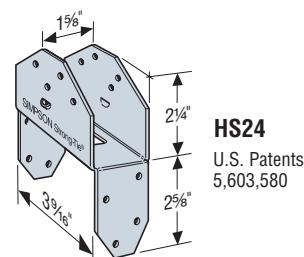

H16 and H16S

Presloped at 5/12. Truss/Rafter Pitch of 3/12 to 7/12 is acceptable

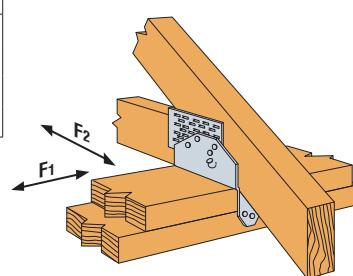

H16 Installation

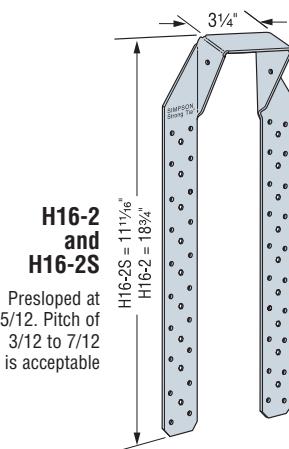

HS24

U.S. Patents
5,603,580

HS24 Installation

1. Loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. When cross-grain bending or cross-grain tension cannot be avoided, mechanical reinforcement to resist such forces should be considered.
3. HS24 DF/SP allowable loads without slant nailing are 605 lbs. (uplift), 590 lbs. (F₁), 640 lbs. (F₂). For SPF/HF loads multiply these values by 0.86.
4. For H16-2S, S = short.
5. Allowable loads in the F₁ direction are not intended to replace diaphragm boundary members or prevent cross grain bending of the truss or rafter members. Additional shear transfer elements shall be considered where there may be effects of cross grain bending or tension.
6. **NAILS:** 10dx1 1/2 = 0.148" dia. x 1 1/2" long, 8d = 0.131" dia. x 2 1/2" long, 8dx1 1/2 = 0.131" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

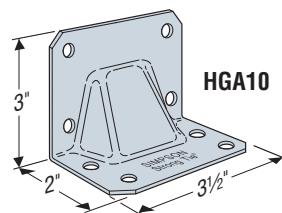

H16-2 and H16-2S

Presloped at 5/12. Pitch of 3/12 to 7/12 is acceptable

Depending on heel height, strap may wrap to back of plate.

Install 4-10dx1 1/2 to inside edge of 2x
Install 6-10dx1 1/2 to face of 2x

HGA10 Installation to Double Top Plates

HGA10 Installation to Rim Joist

LTS/MTS/HTS Twist Straps

Twist straps provide a tension connection between two wood members. They resist uplift at the heel of a truss economically. LTS/ MTS have a 2" bend section and HTS has a 3/4" bend section that eliminates interference at the transition points between the two members.

MATERIAL: LTS—18 gauge; MTS—16 gauge; HTS—14 gauge

FINISH: Galvanized. Some products available in stainless steel and ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION:

- Use all specified fasteners. See General Notes.
- LTS, MTS and HTS are available with the bend reversed. Specify "-REV" after the model number, such as MTS16-REV

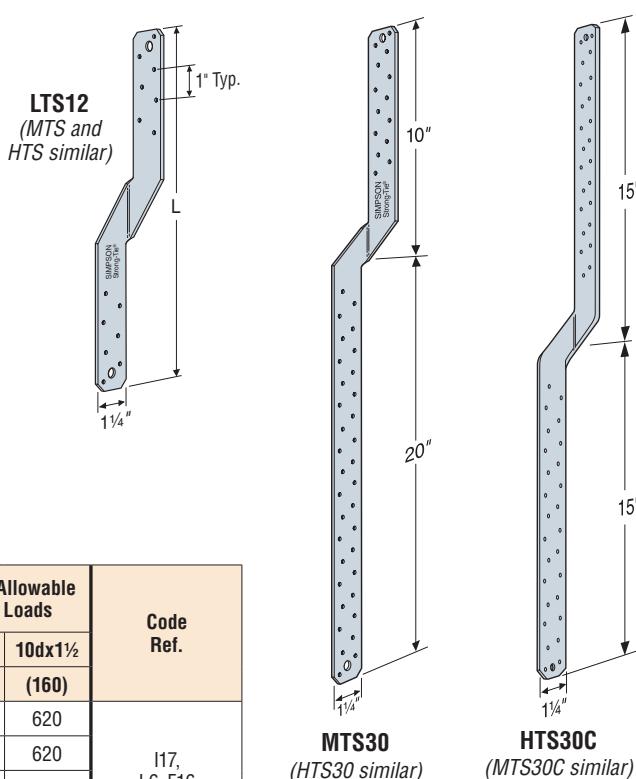

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

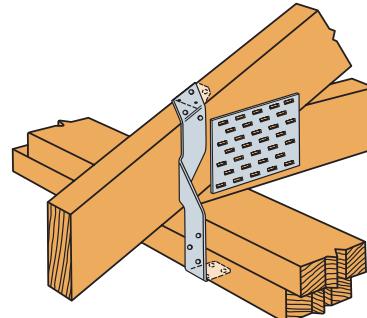

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

1. Loads have been increased for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. LTS12 thru LTS20, MTS16 through MTS30, HTS24 through HTS30 (except HTS30) have additional nail holes.
3. Install half of the fasteners on each end of strap to achieve full loads.
4. All straps except the MTS30 and HTS30 have the twist in the center of the strap.
5. Twist straps do not have to be wrapped over the truss to achieve the load.
6. May be installed on the inside face of the stud.
7. Allowable lateral loads are $F_1 = 75$ lbs. and $F_2 = 125$ lbs. when the following installation requirements are met. The first 7 nail holes each side of the bend must be filled with 10dx1½ minimum nails. All additional fasteners may be installed in any remaining strap holes.
8. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

HTSQ Twist Strap

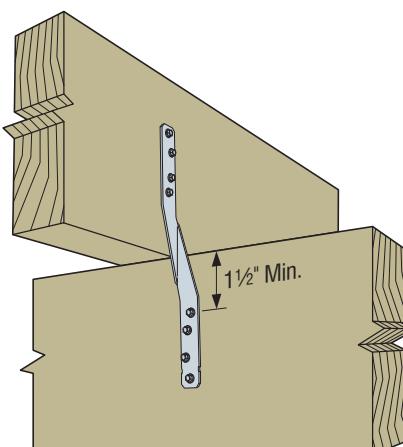

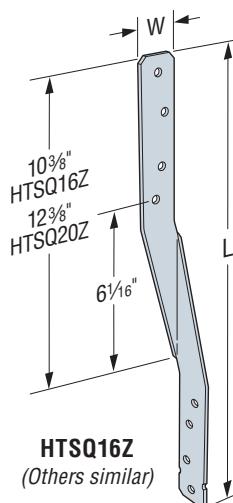

The HTSQ twist straps provide a tension connection between two wood members and are designed to resist uplift for decks, boardwalks and beams economically. The HTSQ is quicker, easier and more economical to install when compared to bolted straps. HTSQ provides a strong connection with fewer fasteners than nailed HTS straps when incorporating Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws. Strong-Drive SDS screws with a double-barrier coating finish are included with HTSQ straps in a ZMAX® coating. For stainless-steel HTSQ straps, stainless-steel SDS Heavy-Duty Connector screws are provided.

FEATURES:

- Quicker and more consistent installation than bolts
- Better fastener withdrawal resistance than nails
- Corrosion resistance finish options

MATERIAL: 14 gauge**FINISH:** ZMAX coating or stainless steel.**INSTALLATION:**

- Use all specified fasteners. See General Notes.

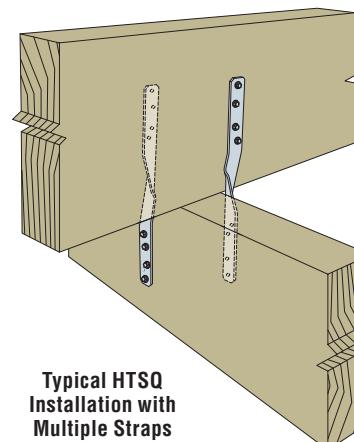

CODES: See page 12 for Code Reference Key Chart.

Typical HTSQ16Z Installation

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Dimensions (in.)		Fasteners	Allowable Uplift Loads				Code Ref.
				DF/SP		SPF/HF		
	(W)	(L)		(100)	(160)	(100)	(160)	
HTSQ16ZKT or HTSQ16SS-SDS	1 1/4	16	8-1/4" x 1 1/2" SDS	1000	1145	720	800	170
HTSQ20ZKT or HTSQ20SS-SDS	1 1/4	20						

- 1.Uplift (160) loads have been increased for wind or earthquake loading with no further increase allowed.
- 2.Tabulated loads are for a single connector. Multiple connectors may be used when the fasteners do not interfere.
- 3.Install four fasteners in each member to achieve full loads. HTSQ20 has (2) extra holes per side to allow for installation flexibility

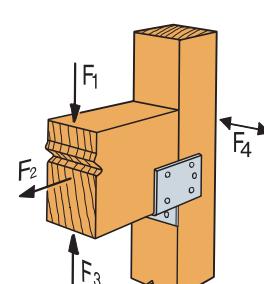

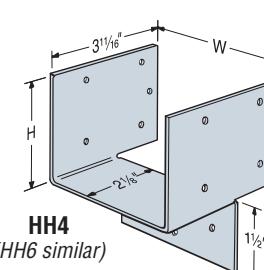

Typical HTSQ Installation with Multiple Straps

HH Header Hangers

For fast, accurate installation of door and window headers and other cross members. HH header hangers can speed up the job, strengthen the frame, and eliminate the need for trimmers.

MATERIAL: 16 gauge**FINISH:** Galvanized**INSTALLATION:** • Use all specified fasteners. See General Notes.

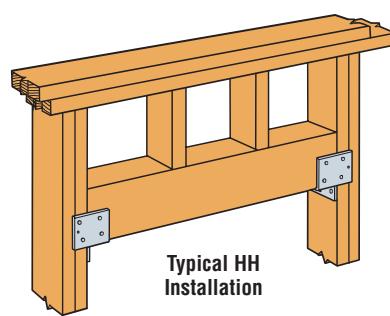

- Attachment to 2x studs will result in two round holes not being filled in the studs and load reductions as noted in table.

CODES: See page 12 for Code Reference Key Chart.

HH Load Directions

Model No.	W	H	Min. Post Size	Fasteners		DF/SP Allowable Loads				Code Ref.	
				Stud	Header	F1		F2	F3		
						(100)	(115)	(125)	(160)		
HH4	3 1/2	2 13/16	2x	7-10dx1 1/2	4-10dx1 1/2	855	965	1035	—	575	725
			Dbl 2x	7-16dx2 1/2	4-16dx2 1/2	1010	1140	1195	—	710	750
			3x	9-16d	4-16d	1295	1470	1585	780	795	1085
HH6	5 1/2	5 1/8	2x	10-10dx1 1/2	6-10dx1 1/2	1220	1380	1480	—	1065	1025
			Dbl 2x	10-16dx2 1/2	6-16dx2 1/2	1440	1595	1595	—	1065	1085
			3x	12-16d	6-16d	1730	1960	2115	1025	1105	1700

- 1.Loads have been increased with no further increase allowed; reduce where other loads govern.
- 2.For 3x posts, 16dx2 1/2" nails may be substituted with no reduction in load.
- 3.For SPF/HF lumber use 0.86 x DF/SP allowable loads.
- 4.NAILS: 10dx1 1/2" = 0.148" dia. x 1 1/2" long, 16dx2 1/2" = 0.162" dia. x 2 1/2" long, 16d = 0.162" dia. x 3 1/2" long.
See pages 22-23 for other nail sizes and information.

Typical HH Installation

LGT/MGT/VGT/HGT Girder Tiedowns

The LGT, MGT, VGT and HGT are girder tiedowns for moderate to high load capacity applications. The LGT and VGT are also suitable for retrofit applications.

LGT connectors provide a low profile connection to the studs for easy installation of drywall. Simple to install and can be installed on the inside or outside of the wall. LGT connectors also provide exceptional bearing enhancement for heavy download applications. The LGT series has been extended to include the new LGT4-SDS3 for 4-ply girders.

The Variable Girder Tiedown (VGT) is a higher capacity alternative to the LGT and MGT for girder trusses. It attaches with Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws to the side of truss and features a predeflected crescent washer that allows it to accommodate top chord pitches up to 8/12. The VGT is also available with one flange concealed for attachment to trusses with no tail.

The HGT offers the highest uplift capacity for girders and can be installed on trusses and beams with top chord slopes up to 8/12.

MATERIAL: HGT, VGT—7 gauge, LGT2—14 gauge, MGT, LGT3, LGT4—12 gauge.

FINISH: HGT—Simpson Strong-Tie® gray paint; LGT, MGT, VGT—Galvanized

INSTALLATION: • When the HGT-3 is used with a 2-ply girder or beam, shimming is required. Fasten to act as one unit.

- Before installing fasteners, ensure LGT3-SDS2.5 makes complete contact with bottom of truss.
- Strong-Drive SDS Heavy-Duty Connector screws included with LGT3, LGT4 and VGT Series.
- VGT—Can be installed on roof pitches up to 8/12 or on a bottom chord designed to transfer the load.
- VGT—Screw holes are configured to allow for double installation on a two-ply (*minimum*) truss.
- VGT—The product can be installed in a single application or in pairs to achieve a higher uplift capacity.
- VGT—When installed on trusses with no overhangs, specify VGTR/L.
- VGT—Install washer component (*provided*) so that top of washer is horizontal as well as parallel with top of wall top plate.
- LGT3-SDS2.5—The four large hexagon holes are intended for CMU and concrete applications.
- See pages 182-183 for masonry applications.

OPTIONS: • LGT3 and LGT4 are available with reduced widths of W = 4 $\frac{3}{4}$ " and W = 6 $\frac{5}{16}$ " — order as LGT3-SDS2.5 and LGT4-SDS3.

CODES: See page 12 for Code Reference Key Chart.

HGT-4	1	4 ply	9	2-%	16-10d	9250	9250	

- Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
- LGT2—F₁ load = 700 lbs.; F₂ load = 170 lbs. with installation of 4-16d sinkers optional nail holes.
- LGT3—F₁ load = 795 lbs.; F₂ load = 410 lbs.
- LGT4—F₁ load = 2000 lbs.; F₂ load = 675 lbs. with installation of 7-16d sinkers in optional nail holes.
- MGT—Uplift for DF/SP girder and SPF studs is 3860 lbs.
- MGT can be installed with straps vertical for full table load provided all specified nails are installed to either a solid header or minimum double 2x6 web.
- LGT connectors can provide bearing enhancement loads for truss download reactions. The DF/SP allowable load shall be

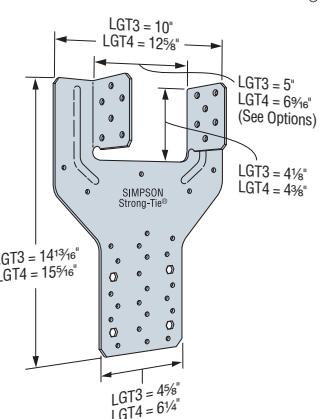

2060 lbs. for LGT2 and 4100 lbs. for LGT4 (*for SPF/HF values use a 0.68 multiplier*). For more information refer to technical bulletin T-HTIEBEARING.

8. Girder tiedowns installed on the outside of the wall require a 3 1/2" overhang to achieve table loads.
9. Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Sections 7.5.3.4 and 8.9.2 are met (*pre-drilling required through the plate using a maximum of 9/32" bit*).
10. NAILS: 16d Sinker = 0.148" dia. x 3 1/4" long, 10d = 0.148" dia. x 3" long. See pages 22-23 for other nail sizes and information.

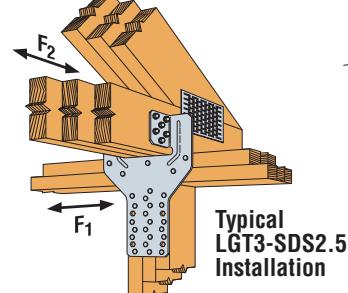

Install two LBP $\frac{5}{8}$ " washers on top of each crescent washer (*total four $\frac{5}{8}$ " washers*) for wood installation. All washers and crescent washers are required. Crescent washers are supplied.

LGT3-SDS2.5
Installation

Typical LGT2 Installation

LGT2

HGT-2
(HGT-3,
HGT-4 similar)

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The Stud Plate Tie series offers general solutions for connecting the stud to the top and bottom plates. All models can be used to make a connection to either the top or bottom plate, and several are suitable for double top plates and studs.

MATERIAL: DSP/SSP/SPH—18 gauge; TSP—16 gauge; all others—20 gauge
FINISH: Galvanized. Some products available in ZMAX® coating;

see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners; see General Notes.

- TSP/DSP/SSP—sill plate installation—fill all round holes.
- TSP/DSP/SSP—top plate installation—fill all round and triangle holes
- SP1/SP2/SP3/SP5—one of the 10d common stud nails is driven at a 45° angle through the stud into the plate.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

1. SP1/SP2—drive one stud nail at an angle through the stud into the plate to achieve the table load (see illustration).
2. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
3. RSP4—see Installation details (1) and (2) for reference.
4. RSP4 F₂ is 250 lbs. (installation 1) and 250 lbs. (installation 2). F₁ load is 210 lbs. for both installations.
5. Maximum load for SPH in Southern Yellow Pine is 1490 lbs for center loading and 745 lbs for side loading.
6. When cross-grain bending or cross-grain tension cannot be avoided, mechanical reinforcement to resist such forces should be considered.
7. For retrofit application see technical bulletin T-C-STRAPS.
8. Use Side (eccentric) load when uplift loads are applied to only one face of the top plate.
9. Use Center (concentric) loads when uplift loads are applied at the centerline of the top plate, or where equal loads are applied to both sides of the top plate. Center loads should also be used for stud to bottom plate loads.
10. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1 1/2" = 0.148" dia. x 1 1/2" long, 8dx1 1/2" = 0.131" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

LTP4/LTP5/A34/A35 Framing Angles & Plates

The larger LTP5 spans subfloor at the top of the blocking or rim joist. The embossments enhance performance.

The LTP4 Lateral Tie Plate transfers shear forces for top plate-to-rim joist or blocking connections. Nail holes are spaced to prevent wood splitting for single and double top plate applications. May be installed over plywood sheathing.

The A35 anchor's exclusive bending slot allows instant, accurate field bends for all two- and three-way ties. Balanced, completely reversible design permits the A35 to secure a great variety of connections.

MATERIAL: LTP4/LTP5—20 gauge; all others—18 gauge

FINISH: Galvanized. Some products available in stainless steel or ZMAX® coating; see Corrosion Information, pages 13–15.

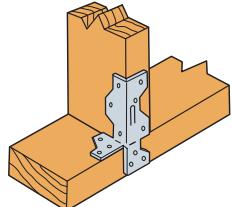

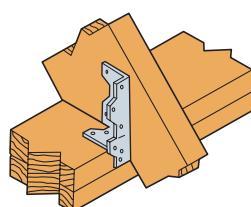

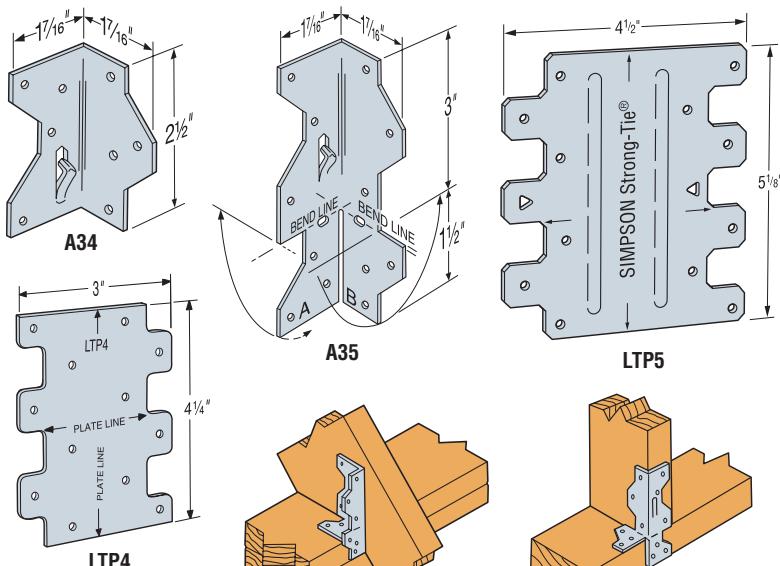

INSTALLATION: • Use all specified fasteners. See General Notes.

- A35—Bend one time only.

CODES: See page 12 for Code Reference Key Chart.

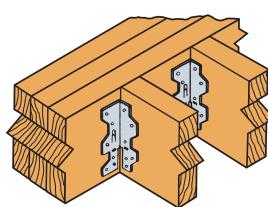

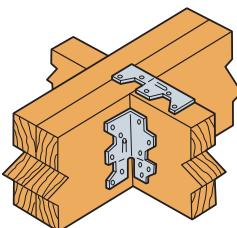

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

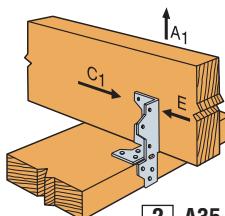

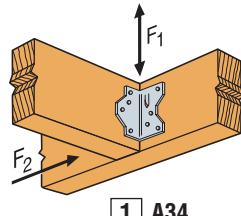

Joists to Plate
with A Leg Inside

Studs to Plate
with B Leg Outside

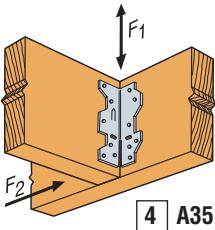

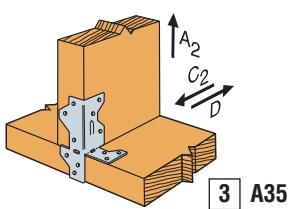

Joists to Beams

Ceiling Joists to Beam

1 A34

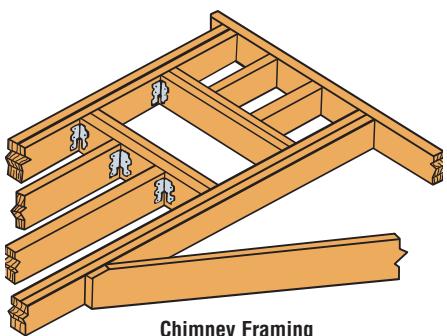

2 A35

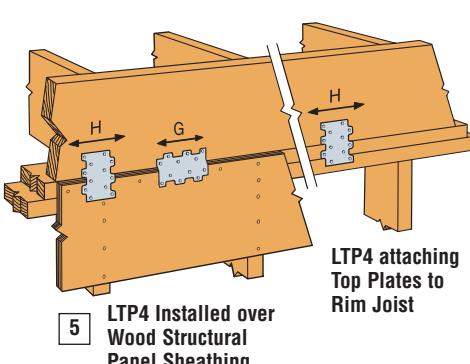

3 A35

4 A35

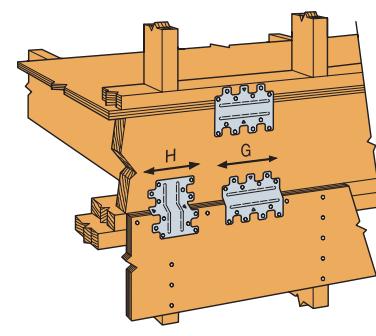

1. Allowable loads are for one anchor. When anchors are installed on each side of the joist, the minimum joist thickness is 3".
2. Some illustrations show connections that could cause cross-grain tension or bending of the wood during loading if not reinforced sufficiently. In this case, mechanical reinforcement should be considered.
3. LTP4 can be installed over $\frac{3}{8}$ " wood structural panel sheathing with 8dx1½" nails and achieve 0.72 of the listed load, or over $\frac{1}{2}$ " and achieve 0.64 of the listed load. 8d commons will achieve 100% load.
4. The LTP5 may be installed over wood structural panel sheathing up to $\frac{1}{2}$ " thick using 8dx1½" nails with no reduction in load.
5. Connectors are required on both sides to achieve F₂ loads in both directions.
6. **NAILS:** 8dx1½" = 0.131" dia. x 1½" long.
See pages 22–23 for other nail sizes and information.

6 LTP5 Installed over Wood
Structural Panel Sheathing

RBC Roof Boundary Clip

The RBC Roof Boundary Clip is designed to aid installation and transfer shear loads between the roof diaphragm and wall. The locator tabs make proper location of the clip easy. The RBC can be used on wood or masonry walls and will handle roof pitches from 0/12 to 12/12.

MATERIAL: 20 gauge **FINISH:** Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- Field bend to desired angle – one time only.
- See flier F-C-RBC for more information on installation and code requirements.

CODES: See page 12 for Code Reference Key Chart.

The RBC installed to blocking resists rotation and lateral displacement of rafter or truss.

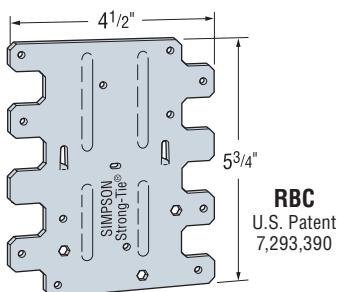

Code references:

- IRC 2009/2012, R802.8 Lateral Support
- IBC 2009/2012, 2308.10.6 Blocking

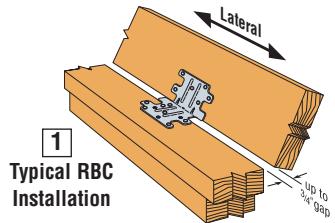

Blocking allows proper edge nailing of sheathing.

Code references:

Typical RBCP
Installation

U.S. Patent
7,549,262

The RBC is available with prongs into one side (RBCP) for pre-attachment of the part to a block at the truss plant. Refer to technical bulletin T-RBCP for more information.

Model No.	Type of Connection	Bending Angle	Fasteners		DF/SP Allowable Loads	SPF/HF Allowable Loads	Code Ref.
			To Wall	To Blocking			
RBC	[1]	45° to 90°	6-10dx1 1/2	6-10dx1 1/2	445	380	IP1, L18, F25
	[2]	< 30°	6-10dx1 1/2	6-10dx1 1/2	435	375	
		30° to 45°	6-10dx1 1/2	6-10dx1 1/2	480	415	
	[3]	0° to 45°	3-1/4x2 1/4 Titen ⁴	6-10dx1 1/2	350	350	

1. Allowable loads are for one anchor attached to blocking minimum 1 1/2" thick.
2. RBC can be installed with up to 3/4" gap and achieve 100% of the listed load.
3. Allowable loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
4. When attaching to concrete use 3-1/4x1 1/4" Titen⁴ screws.
5. RBC installed over 1" foamboard has a load of 395 lbs. (160) in a parallel to wall (F₁) load direction for Douglas Fir. For SPF, the load is 340 lbs.
6. RBC may be installed over 1/2" structural sheathing using 10dx1 1/2" nails with no load reduction.
7. **NAILS:** 10dx1 1/2 = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

A Angles

Our line of angles provides a way to make a wide range of 90° connections.

MATERIAL: A21 and A23—18 ga.; all other A angles—12 ga.

FINISH: Galvanized. Some products available in stainless steel or ZMAX[®] coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

CODES: See page 12 for Code Reference Key Chart.

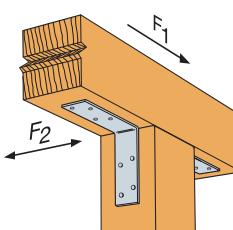

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

These products are approved for installation with the Strong-Drive[®] SD Connector screw. See page 27 for more information.

Z44	12	2 1/2	3 1/2	2	1%	4-16d	865	I14, L18, F13

1. Z28 and Z38 do not have nail holes. Fastener quantity and type shall be per Designer.
2. Allowable loads **may not be increased**.

3. Z4 loads apply with a nail into the top and a nail into the seat.
4. **NAILS:** 16d = 0.162" dia. x 3 1/2" long, 10dx1 1/2 = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

Typical Z2 Installation

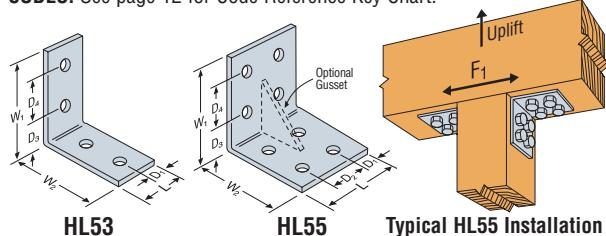

HL Heavy Angles and Gussets

Versatile angle gussets and heavy angles promote standardization and construction economy, and are compatible with Simpson Strong-Tie® structural hardware.

FINISH: 7 ga Models—Galvanized; 3 ga Models—Simpson Strong-Tie® gray paint. **May be ordered HDG. Contact Simpson Strong-Tie.**

OPTIONS: Gussets may be added to HL models when L≥5" (specify G after model number, as in HL46G).

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Ga	Dimensions				Bolts (Total)	Allowable Loads	Code Ref.
		W1 & W2	L	D1	D2			
HL33	7	3 1/4	2 1/2	1 1/4	—	2	2 1/2	910 1580

HL76	3	7 1/4	6 1 1/2	3 2 3/4	3	8 3/4	2115 3800	
HL79	3	7 1/4	9 1 1/2	3 2 3/4	3	12 3/4	2115 3800	

1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. Use 0.85 times table load for Hem Fir.
3. Parts should be centered on the face of the member to which they are attached.
4. Wood members for the '3' and '5' series must have a minimum width and thickness of 3 1/2" for table loads to apply.
5. Wood members for the '4' and '7' series must have a minimum width and thickness of 5 1/8" for table loads to apply.
6. Parts must be used in pairs.
7. Lag bolts of equal diameter (minimum 5" long) may be substituted for machine bolts into beam with no reduction in load.

L/LS/GA Reinforcing and Skewable Angles

L—Staggered nail pattern reduces the possibility for splitting. LS—Field-adjustable 0° to 135° angles. The GA Gusset Angles' embossed bend section provides added strength.

MATERIAL: L—16 gauge; GA and LS—18 gauge

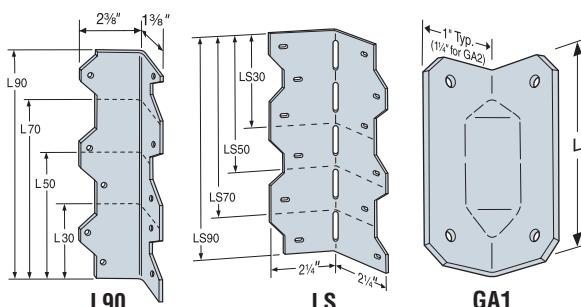

FINISH: Galvanized. Some products available in stainless steel or ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners; see General Notes.

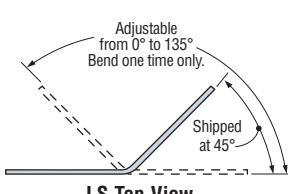

- LS—field skewable; bend one time only.
- Joist must be constrained against rotation (*for example, with solid blocking*) when using a single LS per connection.
- Nail the L angle's wider leg into the joist to ensure table loads and allow correct nailing.

CODES: See page 12 for Code Reference Key Chart.

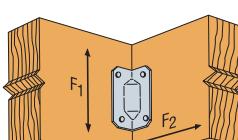

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

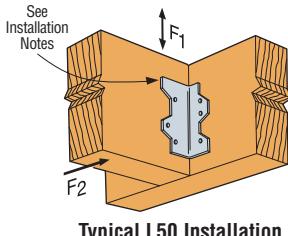

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

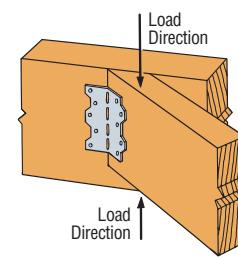

LS Top View

Typical GA Installation

Typical L50 Installation

Typical S70 Installation

1. L angles—loads are for condition F1 or F2; LS angles—loads are for condition F1 only.
2. GA1 and GA2 angles table loads are F1—loads for F2 are 235 lbs. and 355 lbs. (100) and 290 lbs. and 435 lbs. (125), respectively.
3. Roof loads are 125% of floor loads unless limited by other criteria.
4. Connectors are required on both sides to achieve F2 loads in both directions.
5. GA angles may be installed with 10d nails.
6. **NAILS:** 10d = 0.148" dia. x 3" long, 10dx1 1/2 = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

DTT Deck Tension Ties

DTT tension ties are safe, cost-effective connectors designed to meet or exceed code requirements for deck construction. These versatile DTT connectors are also load rated as a holdown for light-duty shearwalls and braced wall panel applications.

For new construction or to make an existing current deck code-compliant, the DTT1Z can be used as a tension-tie to satisfy the 2015 IRC provision for a 750 lbs. lateral load connection to the house at four locations per deck. This new code detail permits the lateral connection from the deck joists to be made to top plates, studs, or headers within the supporting structure, which eliminates the need to access to the floor joists inside the home.

The new DTT1Z fastens to the narrow or wide face of a single 2x with Simpson Strong-Tie® Strong-Drive® SD Connector screws or nails and accepts a $\frac{3}{8}$ " machine bolt, anchor bolt, or lag screw (*washer required*) or can be installed with the new Strong-Drive SDWH Timber-Hex HDG screw with an integral washer. The DTT2 fastens easily to the wide face of a single or double 2x using Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws (included) and accepts a $\frac{1}{2}$ " machine bolt or anchor bolt.

The DTT2 can be used to satisfy the IRC provision for a 1,500 lbs. lateral load connection at two locations per deck. Additionally, the DTT2 has been tested and evaluated in deck guardrail post applications to resist the code-specified lateral forces at the top of railing assemblies. The DTT2 is also available with longer $2\frac{1}{2}$ " Strong-Drive SDS Heavy-Duty Connector screws (model DTT2Z-SDS2.5) to achieve higher loads when needed.

MATERIAL: 14 gauge

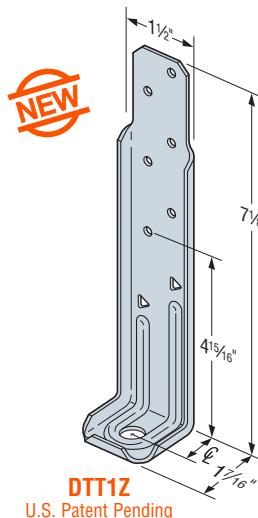

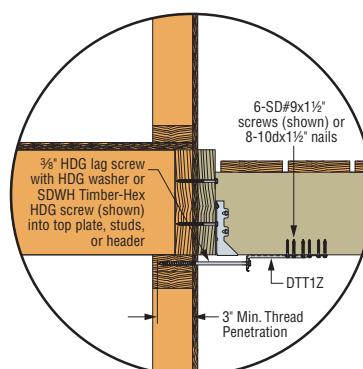

FINISH: DTT1Z/DTT2Z—ZMAX® coating;

DTT2SS—Stainless steel; see Corrosion Information, pages 13-15.

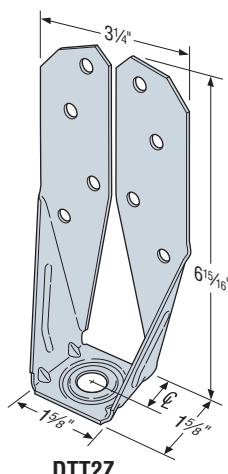

INSTALLATION:

- Use all specified fasteners. See General Notes.
- A standard cut washer (*included*) must be installed between the nut and the seat.
- Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws install best with a low speed high torque drill with a $\frac{3}{8}$ " hex head driver.
- Strong-Drive SD Connector screws install with a $\frac{1}{4}$ " hex head driver.
- Strong-Drive SDWH Timber-Hex HDG screws install with a $\frac{1}{2}$ " hex head driver.

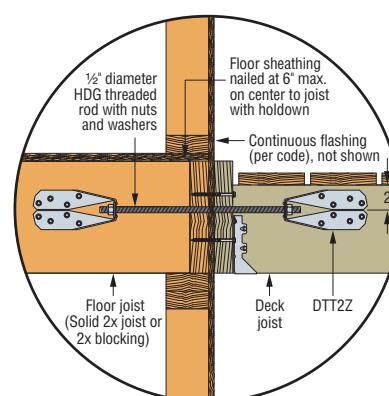

CODES: See page 12 for Code Reference Key Chart.

Model No.	Q	Anchor Dia.	Fasteners	Minimum Wood Member Thickness	Allowable Tension Loads		Code Ref.
					DF/SP	SPF/HF	
DTT1Z	$\frac{3}{4}$	$\frac{3}{8}$ ⁶ or SDWH ³	6-SD #9x1 1/2"	$1\frac{1}{2}$	840	840	160
			6-10dx1 1/2"		910	640*	
			8-10dx1 1/2"		910	850	
DTT2Z/DTT2SS	$\frac{13}{16}$	$\frac{1}{2}$	8-1/4"x1 1/2" SDS	1 1/2	1825	1800	I6, L8, F5
				3	2145	1835	
DTT2Z-SDS2.5	$\frac{13}{16}$	$\frac{1}{2}$	8-1/4"x2 1/2" SDS	3	2145	2105	

1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed.
2. DTT1Z installations with allowable loads below 750 lbs. do not satisfy the 2015 IRC requirements for deck-to-house lateral load connections.
3. The Strong-Drive® SDWH Timber-Hex HDG screw with a minimum of 3" of thread penetration into dry lumber has an allowable withdrawal load (160) of 1380 lbs. into SP, 1225 lbs. into DF and 1020 lbs. into SPF/HF.
4. Load values are valid if the product is flush with the end of the framing member or installed away from the end.
5. The guardrail post illustration above addresses an outward force on the guardrail. An additional DTT2Z can be added at the lower bolt to address an inward force.
6. A $\frac{3}{8}$ " HDG round washer is required when using a log screen.

STRONG-DRIVE® TIMBER Screws

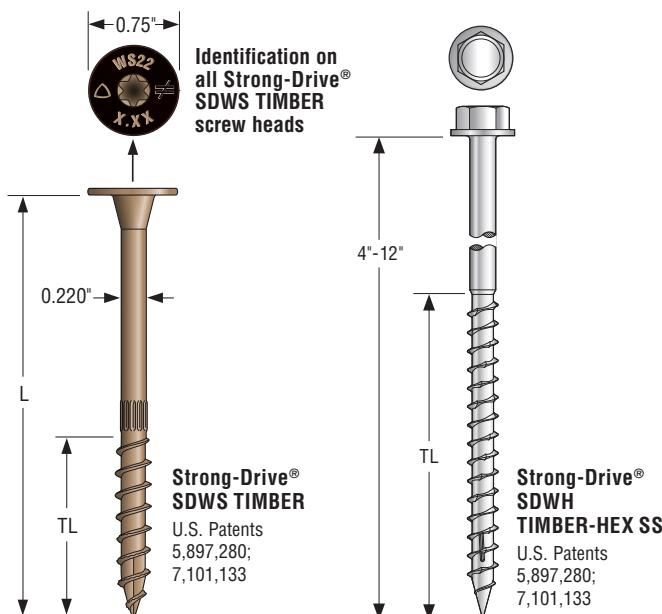

The Strong-Drive® SDWS Timber screw is designed to provide an easy-to-install, high-strength alternative to through-bolting and traditional lag screws. The Strong-Drive SDWH Timber-Hex SS screw provides a structural wood-to-wood connection, including for ledgers. As a Type 316 stainless steel fastener, the Strong-Drive SDWH Timber-Hex SS screw offers maximum corrosion protection.

MATERIAL: Strong-Drive SDWS Timber screw—heat-treated carbon steel, **Strong-Drive SDWH Timber-Hex SS screw—Type 316 stainless steel**

FINISH: Strong-Drive SDWS Timber screw—Double-barrier coating
INSTALLATION: • See General Notes.

- Strong-Drive SDWS Timber screws install best with a low-speed $\frac{1}{2}$ " drill and a T-40 6-lobe bit. The matched bit included with the screws is recommended for best results.
- **Strong-Drive SDWH Timber-Hex SS** screws install best with a low-speed $\frac{1}{2}$ " drill and a $\frac{5}{16}$ " hex driver bit. The matched bit included with the screws is recommended for best results.
- Pre-drilling is typically not required. Where pre-drilling is necessary, use a $\frac{5}{32}$ " drill bit for Strong-Drive SDWS Timber screws and **0.188"** Strong-Drive SDWH Timber-Hex SS screws. **Use a $\frac{7}{32}$ " drill bit for 0.276" Strong-Drive SDWH Timber-Hex SS screws.**
- Screw heads that are countersunk flush to the wood surface are acceptable if the screw has not spun out.
- For additional information, visit www.strongtie.com/fasteners.

CODES: See page 12 for Code Reference Key Chart.

0.220 x 10	SDWS221000DB	2¾	405	365	365	365	310	310	280	280	280		

- All applications are based on full penetration into the main member. Full penetration is the screw length minus the side member thickness.
- Allowable loads are shown at the wood load duration factor of $C_D = 1.0$. Loads may be increased for load duration per the building code up to a $C_D = 1.6$. Tabulated values must be multiplied by all applicable adjustment factors per the NDS.
- Minimum fastener spacing requirements to achieve table loads: 6" end distance, 1½" edge distance, ½" between staggered rows of fasteners, 4" between non-staggered rows of fasteners and 8" between fasteners in a row.
- For in-service moisture content greater than 19%, use $C_M = 0.7$.

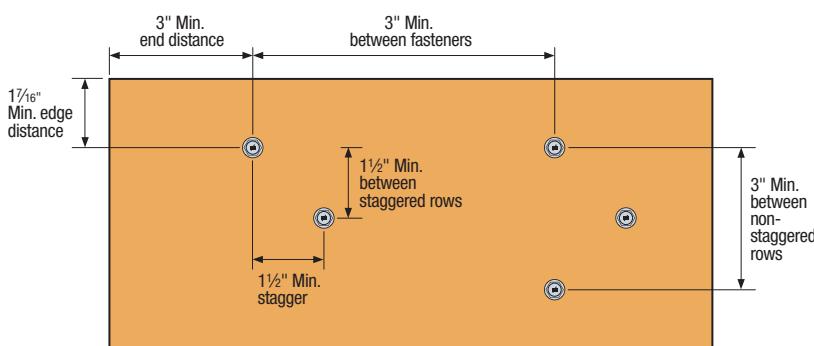

Strong-Drive® SDWS TIMBER Spacing Requirements

Strong-Drive® SDWH TIMBER-HEX SS Screw Allowable Shear Loads – Douglas Fir-Larch, Southern Pine, Spruce-Pine-Fir and Hem-Fir

Size (in.)	Model No.	Thread Length (in.)	Allowable Shear Loads			Code Ref.

0.276 x 12	SDWH271200SS-R25	2.95	235	235	235		

- All applications are based on full penetration into the main member. Full penetration is the screw length minus the side member thickness.
- Allowable loads are shown at the load duration factor of $C_D = 1.0$. Loads may be increased for load duration per the building code up to a $C_D = 1.6$. Tabulated values must be multiplied by all applicable adjustment factors per the NDS.
- Table values based on testing in SPF lumber.
- Minimum fastener spacing requirements: 3" end distance, 1½" edge distance, 1½" between staggered rows of fasteners, 3" between non-staggered rows of fasteners and 3" between fasteners in a row.
- Design values include NDS wet service factor; no adjustment required for in-service moisture content greater than 19%.
- Allowable loads are perpendicular or parallel to grain.
- Installs best with 18v high-torque cordless or ½" low speed drill. If splitting occurs predrill with ⅝" drill bit for 0.188" screws and ⅜" drill bit for 0.276" screws.
- Allowable withdrawal load for the 0.188" screw for DF/SP is 155 lbs./in. and for SPF/HF is 108 lbs./in. Allowable load is based on inches of thread penetration into the main member.
- Allowable withdrawal load for the 0.276" screw for DF/SP is 260 lbs./in. and for SPF/HF is 160 lbs./in. Allowable load is based on inches of thread penetration into the main member.
- For LRFD values, the reference connection design values shall be adjusted in accordance with NDS-12, section 10.3.

Strong-Drive® SDWH TIMBER-HEX SS Screw Spacing Requirements

STRONG-DRIVE® SDWS TIMBER Screws**Strong-Drive® SDWS TIMBER Screw – Douglas Fir-Larch, Southern Pine, Spruce Pine Fir and Hem Fir Lumber Allowable Withdrawal Loads**

Model No.	Fastener Length, L (in.)	Thread Length, TL (in.)	Reference Withdrawal Design Value, W (lbs./inch)		Max. Reference Withdrawal Design Value, W _{Max}		Code Ref.
			DF and SP Main Member	HF and SPF Main Member	DF and SP Main Member	HF and SPF Main Member	
SDWS22300DB	3	1½	164	151	245	225	
SDWS22400DB	4	2¾	179	160	425	380	
SDWS22500DB	5	2¾	214	187	590	495	
SDWS22600DB	6	2¾	214	187	590	495	
SDWS22800DB	8	2¾	214	187	590	495	
SDWS221000DB	10	2¾	214	187	590	495	

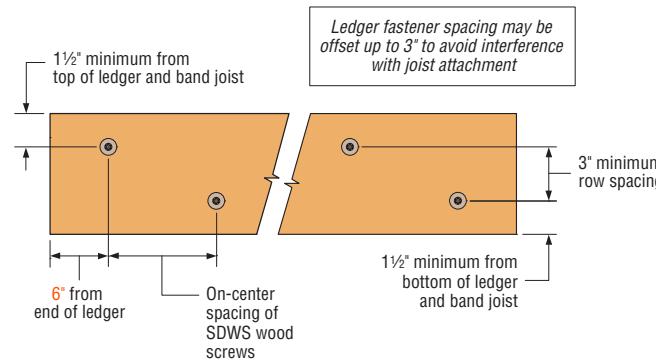

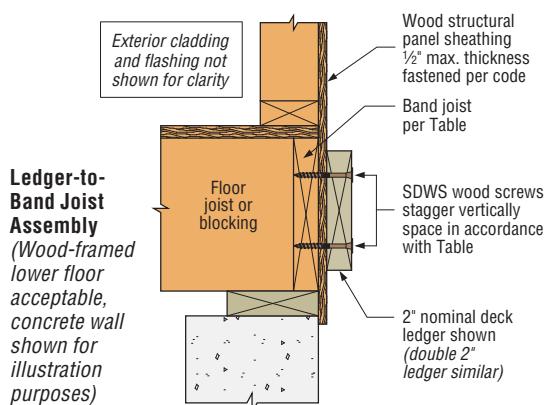

- The tabulated reference withdrawal design value, W, is in pounds per inch of the thread penetration into the side grain of the main member.
- The tabulated reference withdrawal design value, W_{Max}, is in pounds where the entire thread length must penetrate into the side grain of the main member.
- Tabulated reference withdrawal design values, W and W_{Max}, are shown at a C_D = 1.0. Loads may be increased for load duration per the building code up to a C_D = 1.6. Tabulated values must be multiplied by all applicable adjustment factors from the NDS as referenced in the IBC or IRC.
- Embedded thread length is that portion held in the main member including the screw tip.
- Values are based on the lesser of withdrawal from the main member or pull-through of a 1½" side member.
- For in-service moisture content greater than 19%, use C_M = 0.7.

Strong-Drive® SDWS TIMBER Screw – 2009 and 2012 IRC Compliant Spacing for a Sawn Lumber Deck Ledger to Band Joist

- Strong-Drive® SDWS Timber screw spacing values are equivalent to 2009 IRC Table R502.2.2.1. The table above also provides Strong-Drive SDWS Timber screw spacing for a wider range of materials commonly used for band joists, and an alternate loading condition as required by some jurisdictions.
- Solid-sawn band joists shall be Spruce-Pine-Fir, Hem-Fir, Douglas Fir-Larch, or Southern Pine species. Ledger shall be Hem-Fir, Douglas Fir-Larch, or Southern Pine species.
- Fastener spacings are based on the lesser of single fastener ICC-ES AC233 testing of the Strong-Drive SDWS Timber screw with a safety factor of 5.0 or ICC-ES AC13 ledger

- assembly testing with a factor of safety of 5.0. Spacing includes NDS wet service factor adjustment.
- Multiple ledger plies shall be fastened together per code independent of the Strong-Drive SDWS Timber screws.
- Screws shall be placed at least 1½" from the top or bottom of the ledger or band joist, 6" from the end of the ledger with 3" between rows and spaced per the table. See figure below.
- Structural sheathing between the ledger and band shall be a maximum of ½" thick and fastened per code.

1. Screw spacing values are equivalent to 2009 IRC Table R502.2.2.1 and 2012IRC Table R507.2. The table on the left also provides screw spacing for a wider range of materials commonly used for band joists, and an alternate loading condition as required by some jurisdictions.
2. Solid-sawn band joists shall be Spruce-Pine-Fir, Hem-Fir, Douglas Fir-Larch, or Southern Pine species. Ledger shall be Hem-Fir, Douglas Fir-Larch, or Southern Pine species.
3. Fastener spacings are based on the lesser of single fastener ICC-ES AC233 testing with a safety factor of 5.0 or ledger assembly testing with a factor of safety of 5.0. Spacing includes NDS wet service factor adjustment.
4. Multiple ledger plies shall be fastened together per code independent of the screws.
5. Screws shall be placed at least 1½" from the top or bottom of the ledger or band joist, 1½" between staggered rows of fasteners, 3" from the end of the ledger with 3" between rows and spaced per the table.
6. Structural sheathing between the ledger and band shall be a maximum of ½" thick and fastened per code.

DPTZ Deck Post Tie

The DPTZ Deck Post Tie products are used to attach 2x4 (DPT5Z) or 4x4 (DPT7Z) vertical posts to the side of stringers, rims or other wood members.

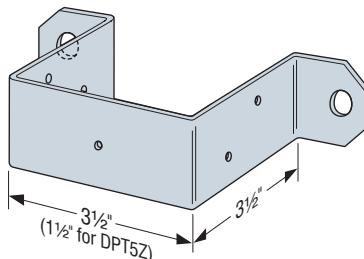

MATERIAL: 14 gauge

FINISH: ZMAX® coating; see Corrosion Information, pages 13-15.

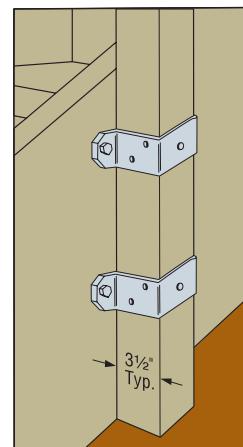

INSTALLATION:

- Use specified HDG fasteners. See General Notes.
- Install in pairs.
- Install with two ⅜" through bolts into side member and 5-10dx1½ to post for DPT5Z or 5-10d for DPT7Z.

 These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

DPT7Z
(DPT5Z similar)

Typical DPT7Z
Stairway Installation
(DPT5Z similar)

LSC Adjustable Stringer Connector

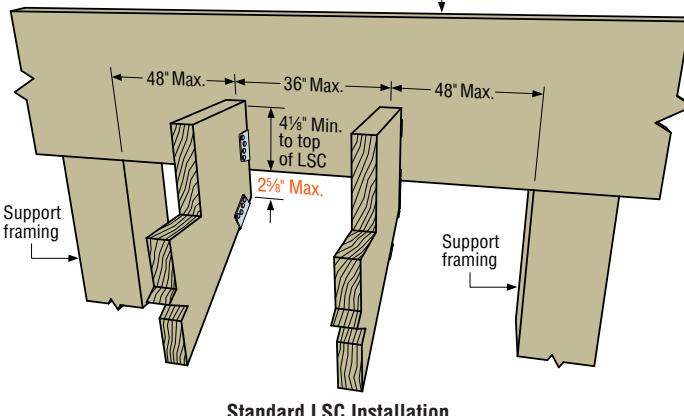

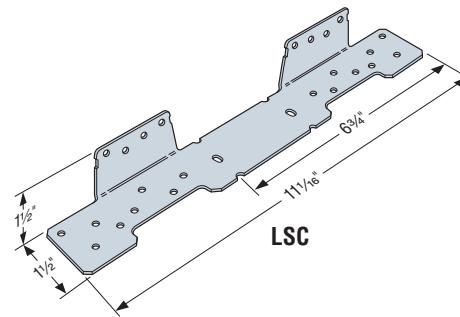

The LSC adjustable stair-stringer connector offers a versatile, concealed connection between the stair stringer and the carrying header or rim joist while replacing costly framing. Field slopeable to all common stair stringer pitches, the LSC connector is suitable for either solid or notched stringers.

Features:

- Replaces additional framing and toe-nailing
- Suitable for most installations on 2x10 or 2x12 header/rim joist
- May be installed flush with the top of the carrying member or lower on the face
- Interchangeable for left or right applications
- LSC features a ZMAX® coating for additional corrosion protection. Suitable for interior and some exterior applications. LSCSS is made from stainless steel for higher exposure environment. See www.strongtie.com/info for more information

MATERIAL: 18 gauge**FINISH:** LSCZ—ZMAX® coating; LSCSS—Stainless steel**INSTALLATION:** • Use all specified fasteners, see table.

- Before fastening, position the stair stringer with the LSC on the carrying member to verify where the bend should be located.
- Tabs on the LSC must be positioned to the inside of the stairs.
- The fastener that is installed into the bottom edge of the stringer must go into the second-to-last hole.
- When installed on 1½" LVL or a 1¼" LSL stringer, additional items that will not affect the structural performance of the LSC, but should be considered, include the following:
 - LSC stringer flange will protrude ¼" from face of stringer. As such, it is recommended the LSC be installed with the tabs positioned to the outside of the stringer.
 - 1½" fasteners installed into 1¼" LSL stringer will protrude from the opposite side.

CODES: See page 12 for Code Reference Key Chart.

Standard LSC Installation

► These products feature additional corrosion protection.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

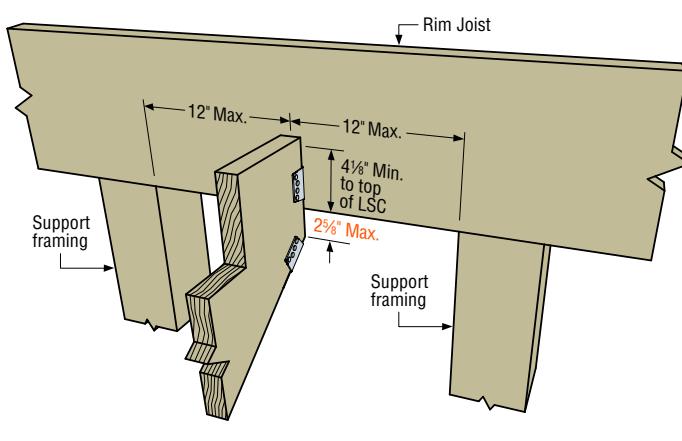

Model No.	Rim Joist Installation	Fastener Schedule			DF/SP Allowable Loads		SPF/HF Allowable Loads		Code Ref.
		Rim Joist ²	Stringer Wide Face	Stringer Narrow Face	Floor (100)	Snow (115)	Floor (100)	Snow (115)	
LSCZ LSCSS	Supported ⁴	8-10dx1 1/2"	8-10dx1 1/2"	1-10dx1 1/2"	950	1000	815	860	I18, L26
	Supported	8-SD #9x1 1/2"	8-SD #9x1 1/2"	—	865	865	670	670	
	Standard	8-10dx1 1/2"	8-10dx1 1/2"	1-10dx1 1/2"	755	755	650	650	
	Standard	8-SD #9x1 1/2"	8-SD #9x1 1/2"	1-SD #9x1 1/2"	755	755	650	650

	Cantilever	8-SD #9x1 1/2"	8-SD #9x1 1/2"	—	545	545	445	445	

1. Stair stringer must be minimum 1 5/16" LVL or minimum 1 1/4" LSL. Allowable loads for DF/SP species material shall apply.
2. When cross-grain tension forces cannot be avoided in the members, mechanical reinforcement to resist such forces may be considered.
3. A minimum distance of 3/4" measured from the lowest rim-joist fastener to edge of rim joist is required.

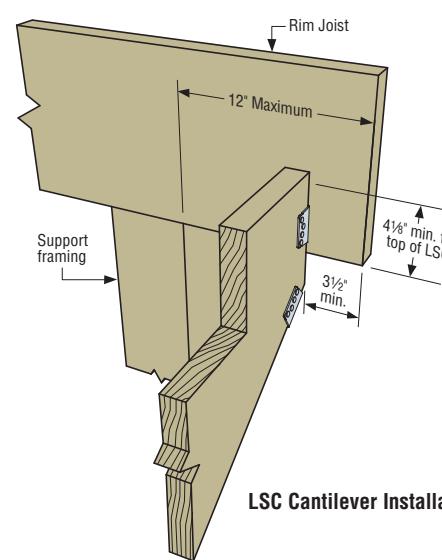

4. Simpson Strong-Tie® #9x1 1/2" Strong-Drive SD Connector screws may be substituted for 10dx1 1/2" nails to achieve published nail values if the extra screw is installed in the narrow face of stringer.

5. NAIL: 10dx1 1/2" = 0.148" dia. x 1 1/2" long. Nails shall be hot-dip galvanized for LSCZ and stainless steel for LSCSS. See pages 22-23 for other nail sizes and information.

6. SCREWS (LSCZ only): SD #9x1 1/2" (model SD9112) = 0.131" dia. x 1 1/2" long (see page 27).

Supported LSC Installation

LSC Cantilever Installation

DJT14Z Deck Joist Tie

The DJT14Z Deck Joist Tie is designed to attach 2x deck joists to the side of 4x or larger support posts. The DJT14Z can be installed with either nails or bolts.

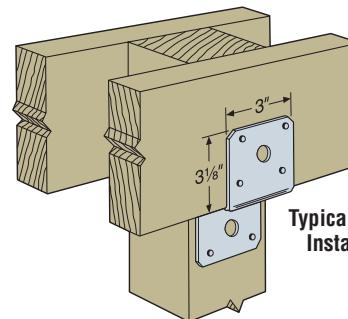

MATERIAL: 14 gauge

FINISH: ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use specified HDG fasteners. See General Notes.

- Recommended: install on post first.
- Minimum 2x4 joist and 4x4 post.

CODES: See page 12 for Code Reference Key Chart.

Typical DJT14Z
Installation

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

Model No.	Fasteners		Allowable Loads				Code Ref.	
	Nails		Nails		Bolts			
	Qty	Dia	Floor (100)	Roof (125)	Floor (100)	Roof (125)		
DJT14Z	8-16d	2	% MB	1160	1400	1220	1400	I18, F17, L5, L13

1. Loads are for one DJT14Z.
2. Roof loads are 125% of floor loads. Floor loads may be adjusted for other load durations according to the code, provided they do not exceed the roof loads.
3. **NAILS:** 16d = 0.162" dia. x 3½" long.
See pages 22-23 for other nail sizes and information.

TA Staircase Angles

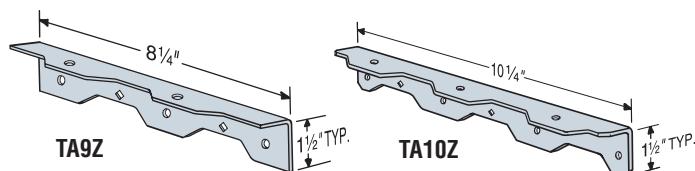

For use in structurally-sound staircase framing. The TA eliminates costly conventional notching.

MATERIAL: 12 gauge

FINISH: TA9Z/TA10Z—ZMAX coating; TA9SS/TA10SS—stainless steel; see Corrosion Information, pages 13-15.

ORDER: May be ordered as kits with model numbers TA9ZKT and TA10ZKT. Each kit includes two ZMAX TA's and Simpson Strong-Tie® ¼"X1½" Strong-Drive® SDS Heavy-Duty Connector screws.

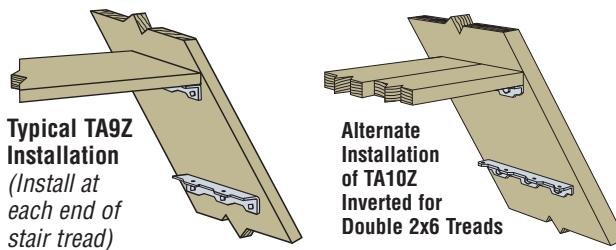

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Fasteners		Allowable Downloads DF/SP (100)	Code Ref.
	Stringer	Tread		
TA9Z	3-SDS ¼"X1½"	2-SDS ¼"X1½"	750	170
TA10Z	3-SDS ¼"X1½"	4-SDS ¼"X1½"	750	
TA10Z	4-SDS ¼"X1½"	3-SDS ¼"X1½"	1000	

1. Loads may be adjusted for other load durations according to the code.
2. See page 26 for Strong-Drive SDS Heavy-Duty Connector screw information.

**ML24/ML26 Angles**

The ML angle combines strength and versatility through the use of Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws. Fastener holes are staggered to minimize wood splitting and opposing hole patterns allows for back to back installation without fastener interference.

MATERIAL: 12 gauge

FINISH: ML24Z/ML26Z—ZMAX® coating; ML24SS/ML26SS—stainless steel; see Corrosion Information, pages 13-15.

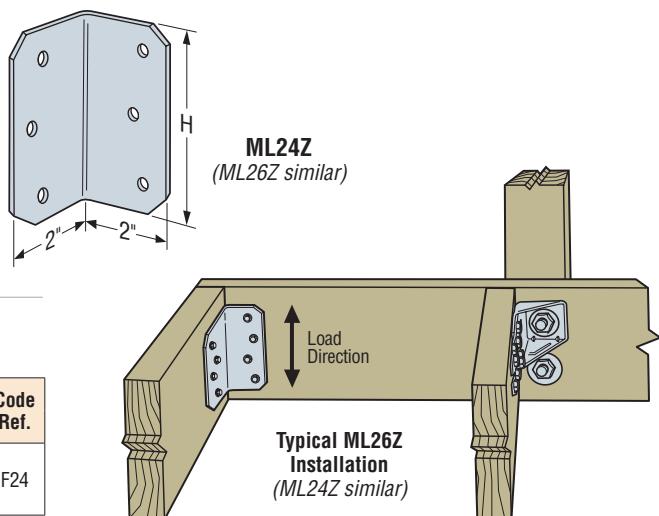

INSTALLATION: • Use all specified fasteners. See General Notes.

- Simpson Strong-Tie ¼"X1½" Strong-Drive SDS Heavy-Duty Connector screws are not provided with the angle.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

KBS1Z Knee-Brace Stabilizer

The KBS1Z knee-brace stabilizer makes a structural connection between knee bracing and columns or beams to help stabilize free-standing structures and comply with many prescriptive deck bracing requirements such as AWC's DCA6 Prescriptive Residential Wood Deck Construction Guide. Factory-formed at a 45° angle and easily installed with nails, the KBS1Z braces 2x, 4x and 6x in line post-to-beam configurations. Check with your local building department for deck bracing requirements.

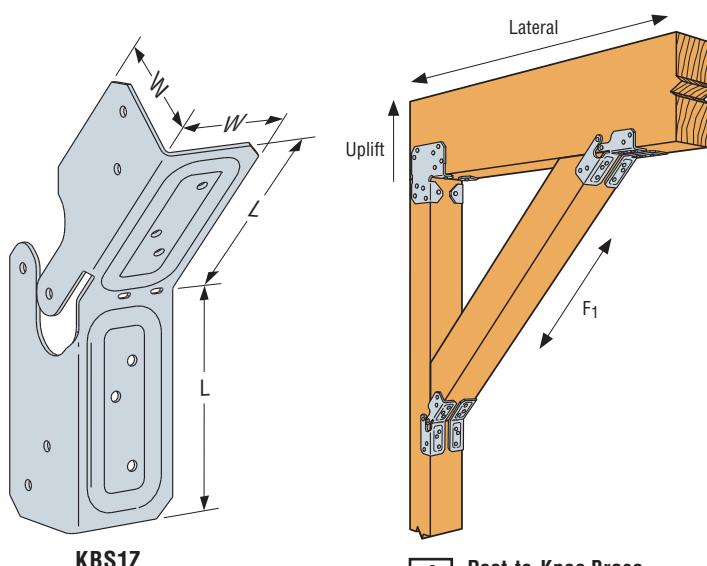

MATERIAL: 16 gauge

FINISH: ZMAX® coating

INSTALLATION:

- Use all specified fasteners. See General Notes.
- For installations at an angle other than 45°, bend KBS1Z along slots to desired angle. Bend one time only.
- Knee Brace:
 - Cut braces at desired angle
 - Bend KBS1Z to desired angle if required
 - Install fasteners to secure in place
 - For equal-width members, install (2) KBS1Z on each end of brace (*see connection type 1*)
 - For 2x knee brace, install single KBS1Z on each end of brace (*see connection type 2*)
- Beam-to-Post: Install in pairs. See illustrations for quantity and configuration.

CODES: See page 12 for Code Reference Key Chart.

1 Post-to-Knee Brace Connection
(Same member width)

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

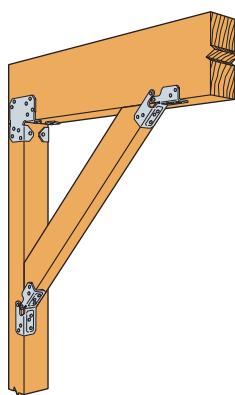

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

Model	Dimensions (in.)		Type of Connection	Connectors per Joint	Fasteners Each Connector ¹	Direction of Load	Allowable Loads ² (160)				Code Ref.

						Lateral	1270	1095	1270	1095		

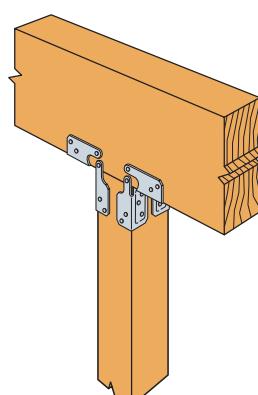

1. SD9x1½ screws may be substituted for the specified fasteners with no load reduction.

2. Allowable loads have been increased for wind or earthquake with no further increase allowed; reduce where other loads govern.

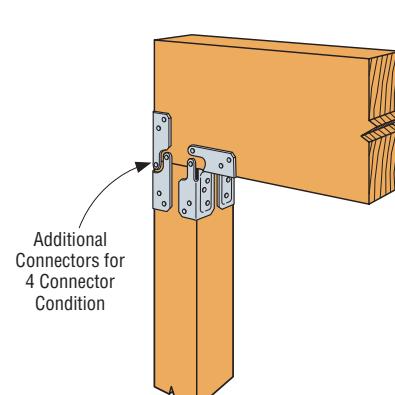

3. For braces installed at intermediate angles, allowable loads may be interpolated between loads listed for brace angle = 45° and brace angle = 30° or 60°.

2 Post-to-2x Knee Brace Connection

3 (Continuous) Beam-to-Post

4 End Beam-to-Post

PGT® Pipe Grip Ties®

Pipe Grip Ties attach wood fence rails to metal fence posts, eliminating rotted and failed wood posts. The PGT is suitable for standard applications as well as corners and splices.

The PGTIC2Z-R is an interior corner pipe grip tie.

The PGT1.5Z-R is for 1½" pipe (1⅞" outside diameter), and the PGT2Z-R is for 2" pipe (2⅜" outside diameter).

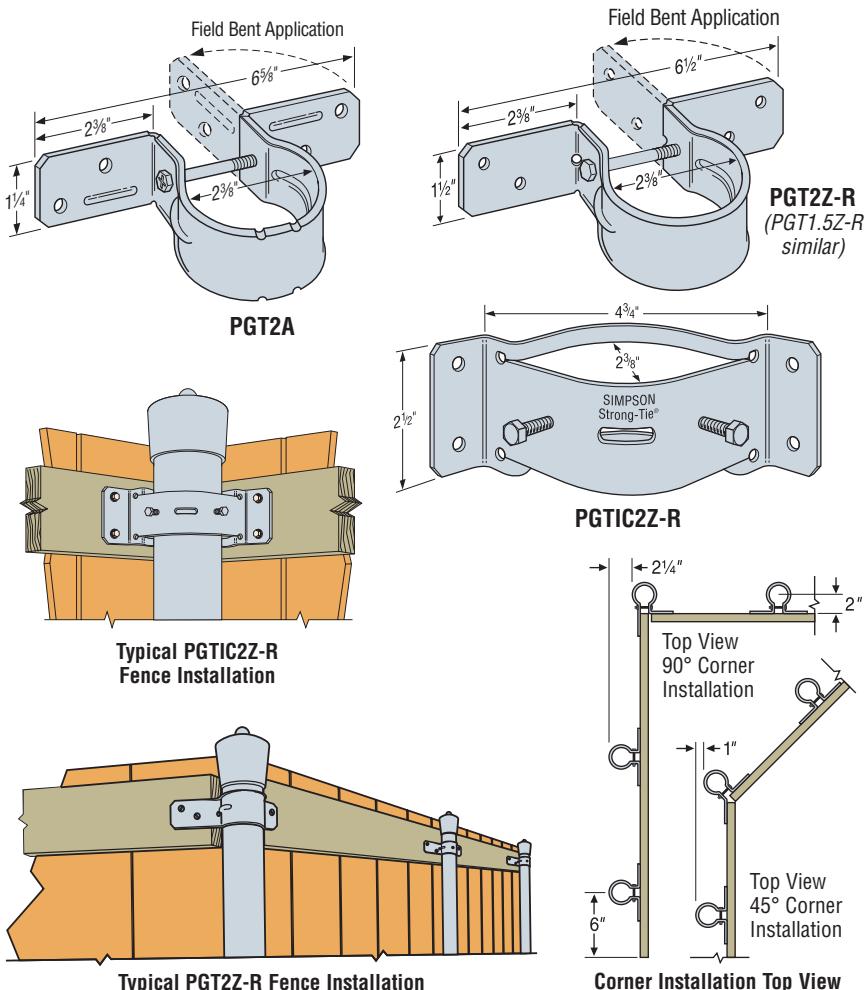

The PGT2A is for 2" pipe (2⅜" outside diameter).

MATERIAL: PGT2A—14 gauge; all others 12 gauge
FINISH: PGT, PGT2-R – Galvanized

PGTIC2Z, PGT1.5Z, PGT2Z-R – ZMAX®

INSTALLATION: • Use all specified fasteners.
See General Notes.

- PGTIC2Z-R To Post – Install two set screws (*supplied*) with $\frac{1}{8}$ socket in predrilled holes.
- PGTIC2Z-R To Rails – Use Simpson Strong-Tie® $\frac{1}{4"} \times 1\frac{1}{2}"$ Strong-Drive® SDS Heavy-Duty Connector screws (*not supplied*).
- Install on vertical pipes, offsetting corners to allow for the correct rail alignment.
- Use 3 to 4 PGTs per pipe; line up to stringline.
- Fasten PGT with $\frac{1}{4}$ " hex head bolt (*supplied*).
- PGT attaches to rails with four Simpson Strong-Tie $\frac{1}{4"} \times 1\frac{1}{2}"$ Strong-Drive SDS Heavy-Duty Connector screws (*not supplied*). See page 26 for Strong-Drive SDS Heavy-Duty Connector screw information.
- $\frac{1}{4}$ " lag bolts may be used. Follow the code requirements for predrilling.
- Nail or screw fence boards to rails.
- Field bend PGT flanges to fit corner and angled conditions (*bend one time only*).

**PGT2E Pipe-Grip Tie**

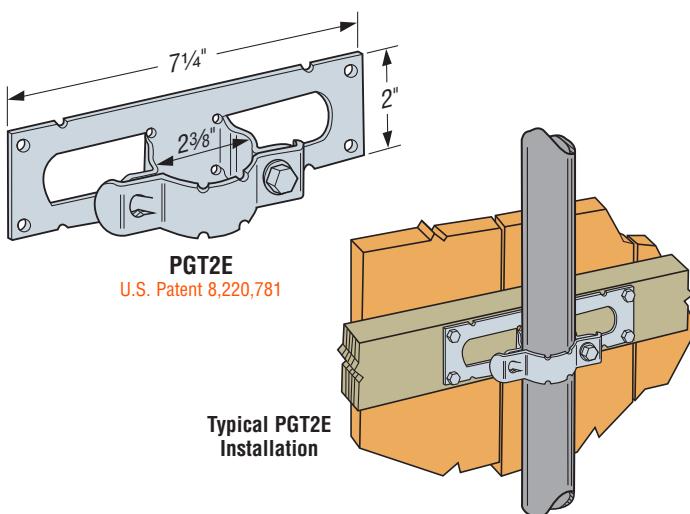

Simpson Strong-Tie introduces the latest time-saving solution for building fences with 2" steel posts. The PGT2E pipe-grip tie features a unique two-piece design that installs quickly and provides a solid connection between fence stringer and post. Snap the attachment plate onto the post for easy positioning and secure the strap using one thread-tapping screw (*included*).

- Faster to install than other two-piece fence-post brackets
- Safer to use, eliminating protruding carriage bolts and sharp corners
- Unique locking tab for the strap means only one screw is needed to fasten

MATERIAL: 12 gauge **FINISH:** Galvanized

INSTALLATION:

- Fasten **two rails** using $\frac{1}{4}$ " Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws or $\frac{1}{4}$ " lag screws (*follow code requirements for pre-drilling*). See page 26 for Strong-Drive SDS Heavy-Duty Connector screw information.
- **PGT2E-R50:** Sold as full carton with (50) attachment plates, (50) front straps and (55) thread-tapping screws.

FB/FBR Fence Brackets

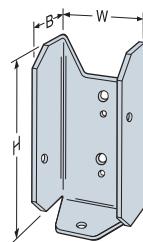

FB and FBR fence brackets make the connection between fence rails and posts simple and strong. Eliminates the need for toe nailing or screwing. Clean, versatile connections make planning and building fences, deck/porch railings and louvers easier and faster.

MATERIAL: See table

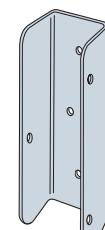

FINISH: FB/FBR—Galvanized; **FB24SS**—stainless steel. Some products available in ZMAX® coating; see Corrosion Information, pages 13-15.

- INSTALLATION:**
- Holes are sized for 8dx1½", 8d commons or Simpson Strong-Tie® 9x1½" Strong-Drive SD Connector screws into the supporting member.
 - FB24R is sized for 10dx1½" or **Simpson Strong-Tie 9x1½" Strong-Drive SD Connector** screws.
 - FB26 is sized for **Simpson Strong-Tie 9x1½" Strong-Drive SD Connector** screws.

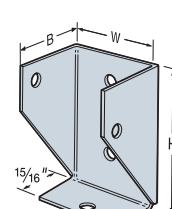

CODES: See page 12 for Code Reference Key Chart.

FBR24	18	2x4	1½"	2½"	1½"	
FB26	18	2x6	1½"	5	1½"	

- FB26 has an allowable load for F_1 of 365 lbs.
- FBR24: R = rail (not rough).
- NAILS:** 10dx1½" = 0.148" dia. x 1½" long, 8d = 0.131" dia. x 2½" long, 8dx1½" = 0.131" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

E-Z Base™/E-Z Mender™/E-Z Spike™ Fence Products

Replacing an entire fence can be an expensive and difficult task. Simpson Strong-Tie® offers a line of products designed to help make reinforcing fence posts easy and economical. The E-Z Base, E-Z Mender and E-Z Spike offer simple solutions for all types of fence post projects.

E-Z Spike (Model No. FPBS44)

- Allows easy installation of 4x4 wood posts without digging holes or pouring concrete.
- Can be used for a variety of applications where quick-to-install posts are needed.

E-Z Mender (Model No. FPBM44E)

- Allows easy repair of rotted or damaged 4x4 wood posts installed in concrete or dirt.
- Reinforces weakened wood posts without having to replace the post or the concrete.
- Sold individually. Use in pairs.

E-Z Base (Model No. FPBB44)

- Allows easy installation of 4x4 wood posts on existing concrete.

MATERIAL: 12 gauge

FINISH: Black powder-coat

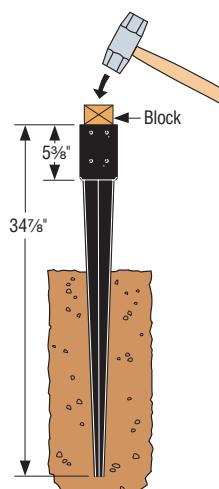

INSTALLATION:

- See flier F-EZFP.
- Attach post to E-Z Spike or E-Z Base with 8-1½" Strong-Drive SDS Heavy-Duty Connector screws or ¼" HDG lag screws and attach post to E-Z Mender using 6 HDG nails or screws per part.

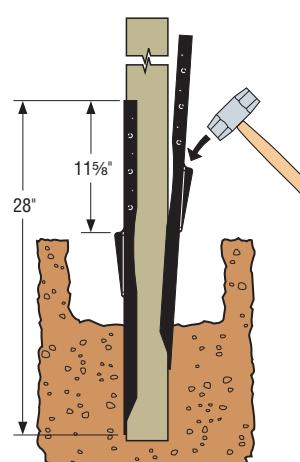

NOTE:

- Notwithstanding the terms of the Limited Warranty, Simpson Strong-Tie does not guarantee, represent or warrant that this product will perform under, or prevent or reduce damage caused by corrosion, any seismic, wind, atmospheric, or other load-producing event.

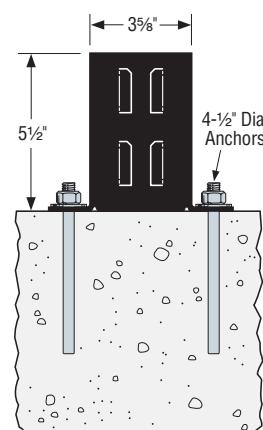

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

RR Ridge Rafter Connector

An interlock provides alignment control and correct nailing locations. For a rafter-to-face connector, flatten the top flange into the face plane. The RR may be used with rafters sloped up to 30°.

MATERIAL: 18 gauge **FINISH:** Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

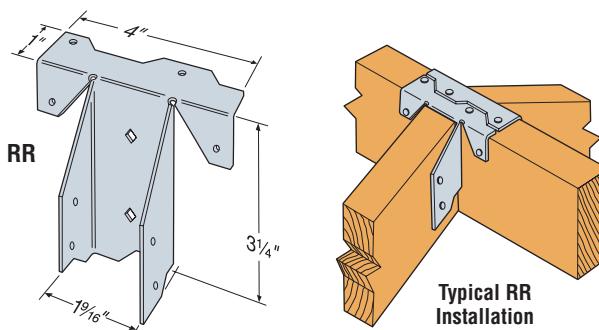

CODES: See page 12 for Code Reference Key Chart.

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

Model No.	Min. Rafter Size	Fasteners		Allowable Loads ¹		Code Ref.	
				DF/SP			
		Header	Rafter	Floor (100)	Roof (125)		
RR	2x6	4-10dx1½"	4-10dx1½"	130	365	415	I10, L5, L11, F9

1. Floor loads may be adjusted for other load durations according to the code, provided they do not exceed the table roof loads.

2. **NAILS:** 10dx1½" = 0.148" dia.x1½" long. See pages 22-23 for other nail sizes and information.

**PSCL/PSCA** Panel Sheathing Clips

Simpson Strong-Tie® Panel Sheathing Clips are used to brace unsupported sheathing edges. The PSCA is a new version of the PSCL with less material for a more cost effective solution. Model sizes include: PSCL¾, PSCA⅓, PSCL⅓, PSCA⅓, PSCL⅓, PSCL⅓, PSCL⅓, PSCL⅓, PSCL⅓, PSCL⅓, PSCL⅓.

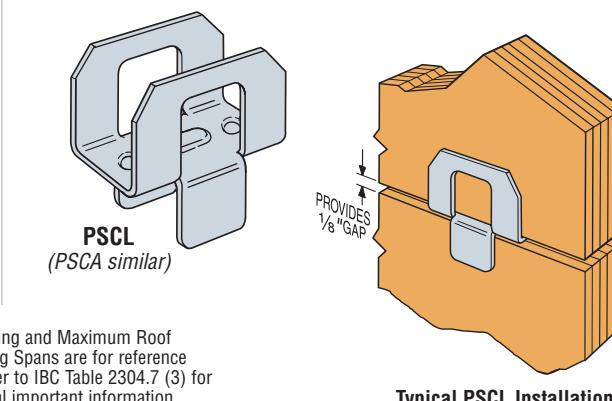

MATERIAL: 20 gauge **FINISH:** Galvanized

INSTALLATION: • Use the same size sheathing clip as the panel thickness.

- Maximum spans may be reduced for low slopes or high uniform loads, refer to manufacturer's installation instructions.

CODES: See page 12 for Code Reference Key Chart.

Span Rating	Panel Thickness	Maximum Roof Sheathing Span		No. of Clips Per Span	Code Ref.
		With Clip	Without Clip		
24/0	¾	24	20	1	
24/16	⅓	24	24	1 ²	
32/16	⅓, ½	32	28	1 ²	
40/20	⅓, ⅓	40	32	1	
48/24	¾	48	36	2	

1. Span rating and Maximum Roof Sheathing Spans are for reference only, refer to IBC Table 2304.7 (3) for additional important information.
2. Maximum roof sheathing span with single PSCA is 24". For spans > 24" use two PSCA's.

SBV/CF-R Shelf Brackets/Concrete Form Angles

Use the SBV for shelving, counter brackets, window ledge supports, at a very competitive price.

The CF-R is used where a moderate size shelf bracket and reinforcing angle is needed. When used for tilt-up perimeter forming, the nail hole placement ensures substantial re-use.

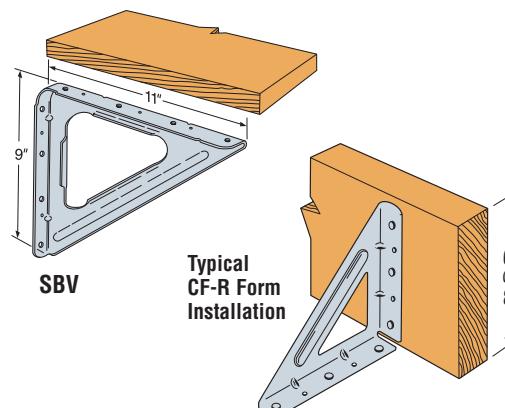

MATERIAL: 16 gauge **FINISH:** Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- SBV—Reversible for nominal 10" or 12" shelves of any thickness.
- CF-R (*Retail Pack*)—Recommended spacing is 36" for 2x's and 18" for 1x's. Use the 5" leg for 6" lumber and the 6" leg for 8" lumber. Holes are sized for ¼" fasteners or 10d commons.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Fasteners	DF/SP Allowable Downloads (100)		Code Ref.
		Stud	(100)	
CF-R	3-SDS ¼"x2"		135	
SBV	4-SDS ¼"x2"		145	170

**DS** Drywall Stop

Eliminates costly blocking at top plate, end walls, and corners. A typical residence will use several hundred of these inexpensive clips with a substantial savings in blocking and labor.

The installation prongs provide even more labor savings.

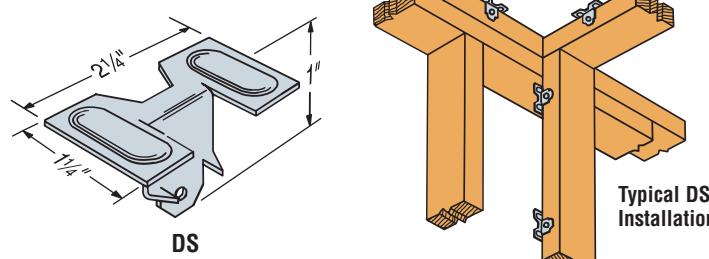

MATERIAL: 20 gauge

FINISH: Galvanized

INSTALLATION:

- 16" on center or less, using 8d commons.
- DS should not be used where gypsum board is used for structural loads.

CODES: ICC ESR-2614, Florida FL-10865.4, City of L.A. RR 25962

RTC/FWH Rigid Tie™ Connectors

The Rigid Tie™ RTC series secures two wood members to a vertical post forming a 90° corner. The RTC42 and RTC44 are heavy-duty structural connectors. Based on loads of 40 lbs. per sq. ft., a 10'x10' deck can be built using 2x8 joists and 4 RTC42s. See the table for post and joist sizes.

RTB—a bracket for intersecting 2x members.

FWH—4 way connectors for 2x members with bendable flanges.

RTA—connects two 2x wood members at a 90° angle.

RTF—connects two members in a "pass-through" application.

RTR and RTU—a 2x member crosses another.

MATERIAL: RTC44—14 gauge; RTA2—16 gauge;

RTR and RTB—20 gauge; all others—18 gauge

FINISH: Galvanized. Some products available in stainless steel or ZMAX® coating; see Corrosion Information, pages 13-15.

INSTALLATION: • Use all specified fasteners. See General Notes.

- Install vertical members first, then attach horizontal members for easier alignment.

- Seat wood member in bracket with a C-clamp before securing to aid positioning and prevent skewing.

- Always follow manufacturer's instructions when using power tools and building equipment.

CODES: See page 12 for Code Reference Key Chart.

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

J/JP Floor Beam Levelers

Jack piers and standard floor beam levelers offer unique leveling simplicity during and after construction.

MATERIAL: 12 gauge plates, ¾" threaded rod, 1 1/16" O.D. steel pipe

FINISH: None.

INSTALLATION: • Use all specified fasteners. See General Notes.

- Holes are provided for installation with 4-10dx1 1/2" nails.
- Do not use J/JPs for dynamic jacking of structures, such as houses.

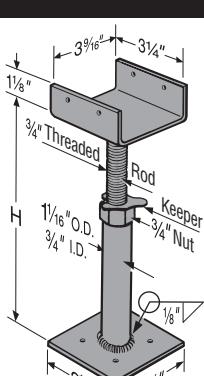

CODES: See page 12 for Code Reference Key Chart.

Model No.	Dimensions		Allowable Bearing Loads (DF/SP/SPF/HF) (100)	Code Ref.
	H (Min-Max) (in.)	Threaded Rod Length (in.)		
JP44	2-4	4 3/4	4440 ¹	
J57	5-7	4	4380	170

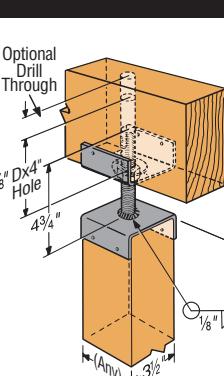

1. Post design by Designer. See pages 245-246 for post allowable loads.

2. Loads may not be increased for short-term loading.

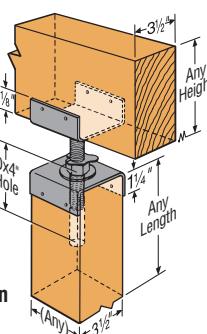

3. **NAILS:** 10dx1 1/2 = 0.148" dia. x 1 1/2" long. See pages 22-23 for other nail sizes and information.

J57 Floor Beam Leveler

Two Methods of JP44 Installation

NS/PSPNZ Nail Stoppers

Nail stoppers help prevent nails from piercing pipes and electrical lines. Installed over utilities that pass through framing members.

PSPN516Z and PSPN58Z protecting shield plate nail stoppers meet IRC, IBC and the International Plumbing Code. PSPN516Z meets structural and protection requirements with one strap.

MATERIAL: 16 gauge

FINISH: Galvanized, PSPN-ZMAX® coating, see Corrosion Information, pages 13-15.

INSTALLATION: • PSPN516Z – 16d commons (see footnote 2 below).

- Other models – 8d commons or prongs.

For more information request flier F-REPRPROTECT.

CODES: See page 12 for Code Reference Key Chart.

PSPN516Z (16 gauge ZMAX) at top plates

- International Residential Code® – 2009/2012 P2603.2.1 & R602.6.1

PSPN58Z	5	8	190
PSPN516Z	5	16½	

2. To meet the prescriptive IRC requirement 16d box nails (0.135" dia. x 3½") may be used.

3. **NAILS:** 16d = 0.162" dia. x 3½" long, 8d = 0.131" dia. x 2½" long.

See pages 22-23 for other nail sizes and information.

PSPN516Z Installation to Sill Plate

CTS218 Compression and Tension Straps

The CTS218 is designed to repair wood members such as top plates, studs and trusses and is our first strap that handles both tension and compression loads. The unique rolled edges of the strap allow it to span gaps as wide as 4½" and its 1½" width enables installation on the narrow face of 2x lumber.

- Tested specifically for top/bottom plate repair with various multi-strap configurations
- Meets the requirements of the IBC and IRC for repairing top plates that have been cut or notched to accommodate plumbing or HVAC ductwork

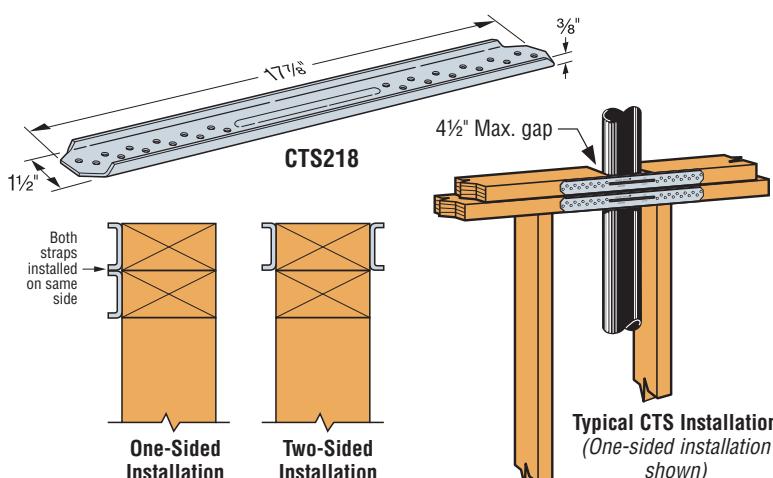

MATERIAL: 14 gauge **FINISH:** Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- **One-sided installations** – install one or two CTS straps on the same side of the member.
- **Two-sided installation** – install CTS straps on opposite sides of member. For three-part installations, install two parts on one side, one part on opposite side.

CODES: See page 12 for Code Reference Key Chart.

- International Building Code® – 2009/2012 2308.9.8

Typical CTS Installation
(One-sided installation shown)

► These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

	4	Two Sided		5470	9920	4700	8600	

1. Allowable loads have been increased for wind or seismic with no further increase allowed. Reduce where other loads govern.
2. Fastener quantities are for a single strap.
3. Maximum gap between wood members is 4½".
4. **FASTENERS:** 10dx1½ = 0.148" dia. x 1½" long. See pages 22-23 for other nail sizes and information.

RPS Strap Ties

The RPS meets IBC, IRC and City of Los Angeles code requirements for HVAC and pipes in walls.

FINISH: Galvanized, some products available in ZMAX® coating.

See Corrosion Information, pages 13-15.

INSTALLATION: Use all specified fasteners. See General Notes.

CODES: See page 12 for Code Reference Key Chart.

Use RPS22 or RPS28 (16 gauge) to reinforce top plate.

Use RPS18Z, RPS22Z or RPS28Z (16 gauge ZMAX) to reinforce sill plate.

- International Residential Code® – 2009/2012 R602.6.1

- International Building Code® – 2009/2012 2308.9.8

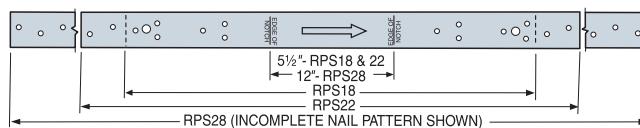

► These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Ga	Dimensions		Notch Width	Fasteners (Total)	Allowable Tension Loads (DF/SP)	Allowable Tension Loads (SPF/HF)	Code Ref.
		W	L					
RPS18	16	1½	18½	≤ 5½"	12-16d	1380	1190	I16, L9, F15

1. Loads include a 60% load duration increase on the fasteners for wind or earthquake loading.

2. To meet the prescriptive IRC requirement 10dx1½ (0.148" dia. x 1½" long) may be used.

3. NAILS: 16d = 0.162" dia. x 3½" long. See pages 22-23 for other nail sizes and information.

RPS

Typical RPS Installation

(Only one strap may be necessary to meet IRC requirements)

HSS/SS Stud Shoes

Stud shoes reinforce studs notched in construction. They are NOT a total replacement of removed material. Installs over pipe up to 2½" outside diameter.

HSS2-3 is designed for triple 2x studs.

HSS stud shoes provide tension load capacity as well as increased compression loads. Flared flange provides greater strength.

MATERIAL: 16 gauge **FINISH:** Galvanized

INSTALLATION: Use all specified fasteners. See General Notes.

- HSS—Bend flanges at 90° angle during installation, then bend back and screw into position (*screws supplied*).
- Bend flanges one cycle only.

CODES: See page 12 for Code Reference Key Chart.

HSS2-SDS1.5 (16 gauge) Heavy stud shoe to reinforce and protect single 2x studs where pipe is located. Uses 12 Simpson Strong-Tie® ¼" x 1½" Strong-Drive® SDS Heavy-Duty Connector screws (*included*).

- International Residential Code® – 2009/2012 R602.6 & P2603.2.1
- International Building Code® – 2009/2012 2308.9.10 & 2308.9.11
- International Plumbing Code – 2009-305.8 / 2012-305.6

HSS2-3-SDS3 (16 gauge) Heavy stud shoe for triple 2x stud. Uses 12 Simpson Strong-Tie ¼" x 3" Strong-Drive SDS Heavy-Duty Connector screws (*included*).

- International Residential Code® – 2009/2012 R602.6 and P2603.2.1
- International Building Code® – 2009/2012 2308.9.10 & 2308.9.11
- International Plumbing Code – 2009-305.8 / 2012-305.6

SS1.5 (16 gauge) stud shoes reinforce and protect plumbing in 2x.

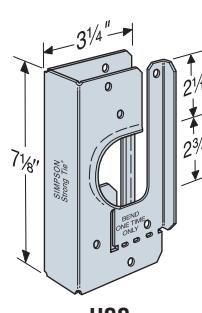

- International Residential Code® – 2009/2012 R602.6 and P2603.2.1
- International Building Code® – 2009/2012 2308.9.10 & 2308.9.11
- International Plumbing Code – 2009-305.8 / 2012-305.6

Model No.	Stud Size	W (in.)	Fasteners	Allowable Loads ¹			Code Ref.			
				DF/SP		Tension

1. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for other load durations according to the code, provided they do not exceed roof loads.

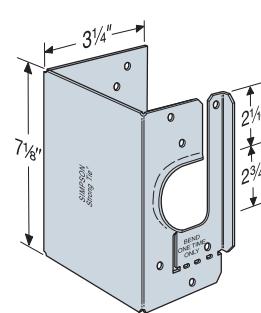

2. NAILS: 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long.

See pages 22-23 for other nail sizes and information.

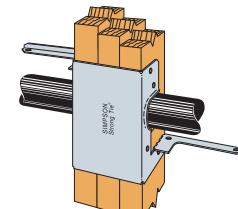

HSS

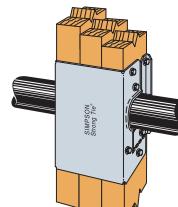

US Patent 6,176,057

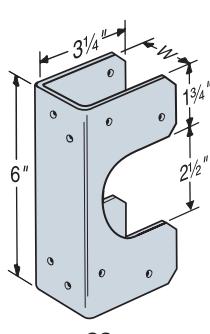

HSS2-3

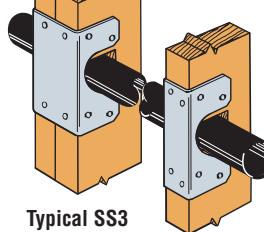

STEP 1
Install HSS (HSS2-3 shown) over stud with flanges bent at a 90° angle. Screw into position.

STEP 2
Bend HSS (HSS2-3 shown) flanges one time only. Screw into position.

Typical SS3 Installation

Typical SS1.5 Installation

NCA/TB/LTB Bridging

NCA—Nailless installation eliminates callbacks for nail squeaks. Designed for secure grip before the drive-home blow, and deeper prong penetration. Precision-formed into a rigid "V" section.

TB—Tension-type bridging with maximum nailing flexibility. Use just two of the seven nail holes at each end.

LTB—Staggered nail pattern accommodates 2x8 and 2x10 joists. Use just two of the six nail holes at each end. LTB40 has rigid prongs that install easily into the joist, and embossments that allow crisp bends.

MATERIAL: LTB—22 gauge; NCA and TB—20 gauge
(except NCA2x12-16—18 gauge).

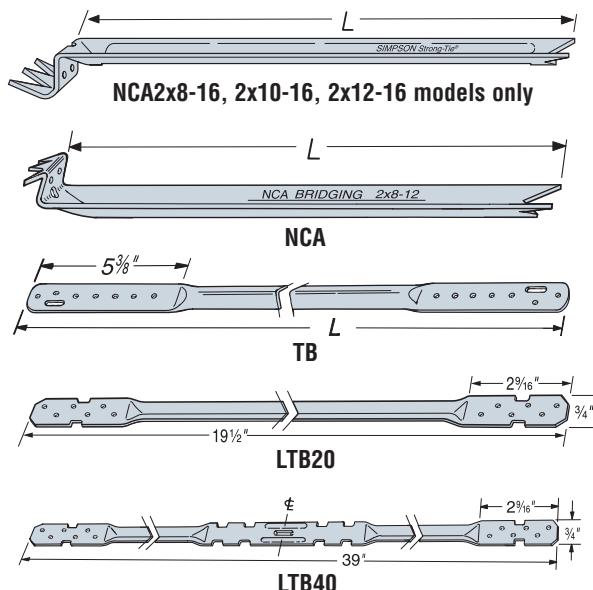

FINISH: Galvanized

- INSTALLATION:** • Support floor joists with a depth-to-thickness ratio of six or more with bridging at intervals not exceeding 8'. If span is greater than 8', install on 2x8 or larger joists. If span is greater than 16', use more than one pair.
- Tension bridging works only in tension, so must be used in cross pairs.
- Install bridging tightly; loose installation may allow floor movement.
- NCA may be installed before or after sheathing, from the top or bottom. Simply locate the bend line approximately 1" from the joist edge.
- NCA has nail holes in one end for use if a prong is bent during installation. Fully seat nails if they are used; otherwise, they may lead to squeaks.
- TB requires two 10dx1½ fasteners per end.
- LTB requires two 6d commons per end.

CODES: See page 12 for Code Reference Key Chart.

Code Reference: IRC 2009/2012, R502.7.1, R802.8.1

Space bridging to avoid contact noises.

2x14	24	—	—	TB36	36	—		
2x16	24	—	—	TB36	36	—		

For all bridging avoid contact between steel members (this may cause squeaks).

Install from below as shown, or from above. Drive upper end into joist approximately 1" from the top.

Typical TB Installation

WB/WBC/TWB/RCWB Wall Bracing

Simpson Strong-Tie® wall bracing products offer effective options to resist racking during construction. Additionally the RCWB and WB can be used to fulfill the same code bracing requirements as a 1x4 let-in brace, but are cost effective and faster to install. Not designed to replace structural panel shearwall load-carrying component.

The WBC (*coiled WBC*) multiple product dispenser pack weighs less than 40 pounds, making storage and transportation easy. WB106C—15 pieces per roll, WB126C—12 pieces per roll, WB143C—10 pieces per roll.

The RCWB features a rolled edge (*the TWB has two rolled edges*) for extra strength and safety.

MATERIAL: WB and WBC—16 gauge; TWB—22 gauge; RCWB—20 gauge

FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

WB and WBC: • Install in "X" pairs or in opposing "V" fashion.

- Use with 16" or 24" o.c. 2x4 (min.) studs.

RCWB and TWB: • Use with 16" o.c. studs.

- Use minimum of 2x4 studs with TWB.

• Use minimum of 2x6 studs with RCWB (*2x4 min. for interior, non-bearing wall*).

- Establish a run-line using the bracing as a straight edge. Single cut a saw kerf $\frac{5}{8}$ " deep (TWB) or $1\frac{1}{8}$ " deep (RCWB) along the run line. If the wall is pre-framed on the floor, place the part into the saw kerf, and put one nail into the top plate. Tilt the wall up and plumb before nailing off top plate, bottom plate and studs according to the nailing schedule.

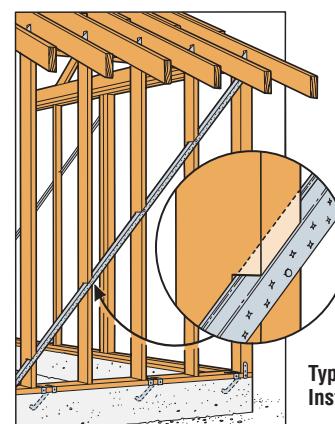

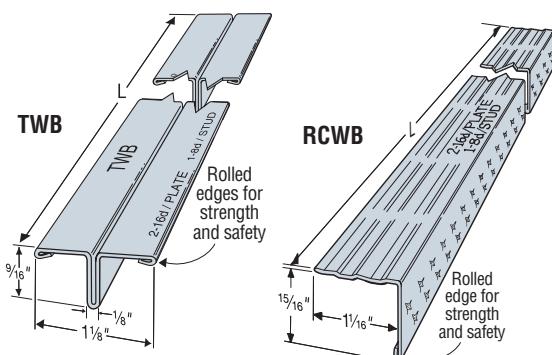

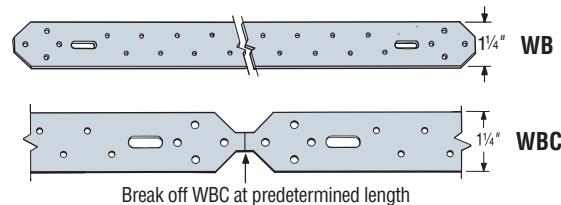

CODES: See page 12 for Code Reference Key Chart.

Model No.	L	Angle and Wall Height	Fasteners		Code Ref.
			Plates	Studs

TWB14	14'-2"	10' @ 45	2-16d	1-8d	I16, L9, F15

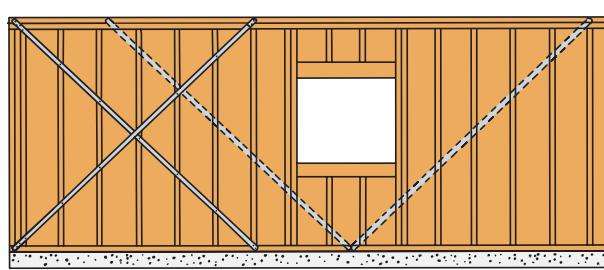

1. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long,

8d = 0.131" dia. x $2\frac{1}{2}$ " long.

See pages 22-23 for other nail sizes and information.

Typical RCWB Installation

WB or WBC Wall Bracing "X" and "V" Applications

IS Insulation Supports

The insulation supports are cut from carbon steel, spring wire for optimum flexibility and strength. Mitered tips dig into the wood, securing itself and insulation when installed between joists.

MATERIAL: 14 gauge **FINISH:** None

INSTALLATION: • Install between joists. IS16 for 16" o.c. spacing; IS24 for 24" o.c. spacing. Follow insulation manufacturer's installation instructions.

- Wear safety glasses, gloves and other appropriate safety equipment.

CODES: See page 12 for Code Reference Key Chart.

Model	Diameter	Length (in.)	Joist Spacing	Code Ref.
IS16-R100	0.08	15 1/2	16" o.c.	180
IS24-R100	0.08	23 1/2	24" o.c.	

Typical IS Installation

ICFVL Ledger Connector System

SIMPSON

Strong-Tie®

The ICFVL Ledger Connector System is engineered to solve the challenges of mounting wood or steel ledgers to insulated concrete form (ICF) walls. The ICFVL is designed to provide both vertical and lateral, in-plane performance. The system offers many benefits over traditional anchor bolting, including better on center spacing in most cases, faster installation and no protrusions.

The embedded legs of the ICFVL are embossed for additional stiffness and the hole enables concrete to flow through and around the connector. The exposed flange on the face of the ICF provides a structural surface for mounting either a wood or steel ledger.

MATERIAL: ICFVL—14 gauge; ICFVL-CW and ICFVL-W—16 gauge

FINISH: Galvanized

INSTALLATION: ICFVL in ICF

- For use with a minimum 4" thick core
- Snap a chalk line for the bottom of the ledger
- Mark required on center spacing
- Use ICFVL to mark kerfs locations
- Cut kerfs as marked
- Insert ICFVL flush to the face of the ICF
- Pour concrete

Wood Ledger Attachment – ICFVL-W or -CW

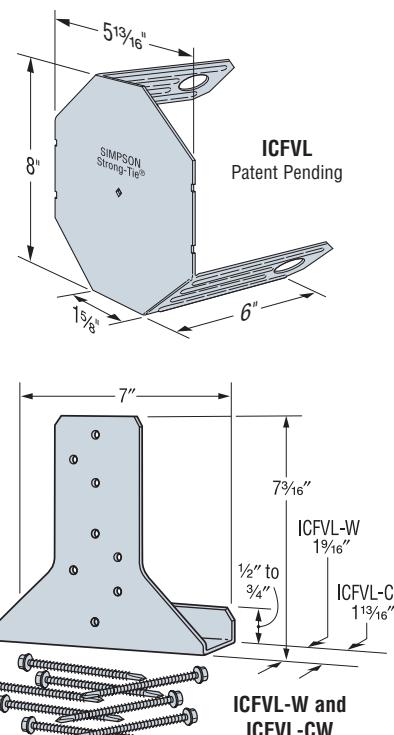

- Slip appropriate ledger connector underneath the ledger
- Install the eight ICF-D3.62 screws partially into the ledger
- Position **bottom** of the ledger level to the chalk line and drive the screws through the wood and into the ICFVL

Steel Ledger Attachment

- Position **bottom** of the ledger level to the chalk line and against the ICFVL
- Attach with four 1/4-14x3/4", #3 drill point screws (*not provided*)
- All screws should be located at least 1/2" from the edge of the ICFVL
- Space screws evenly

CODES: See page 12 for Code Reference Key Chart.

WARNING:
Industry studies show that hardened fasteners can experience performance problems in wet environments. Accordingly, use this product in dry environments only.

Designer shall evaluate as follows:

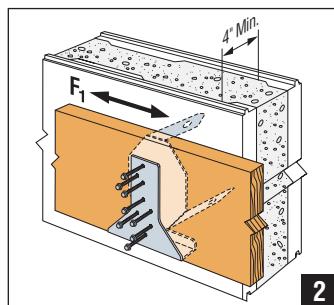

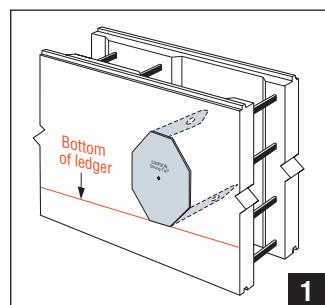

Design Download/Allowable Download + Design Lateral Load/Allowable Lateral Load ≤ 1.

7. The ICFVL must be installed no closer than 4" below the top of the wall to achieve the allowable loads shown. For installations where the ICFVL is installed less than 4" from the top of the wall (*including flush applications*) multiply the allowable loads by 0.94.

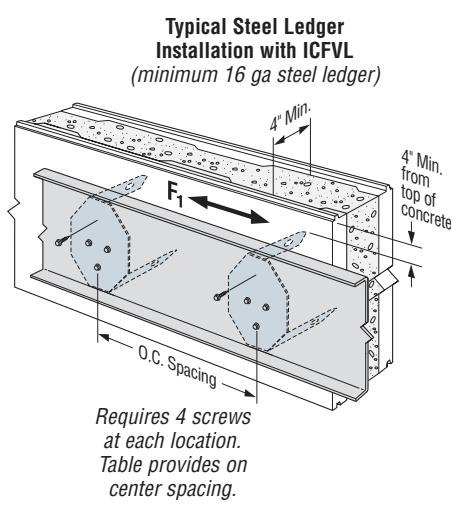

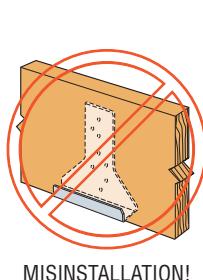

These tables address vertical load applications only.

Ledger Type	Fasteners	ICFVL SPACING TO REPLACE ANCHOR BOLTS (in) ^{1,2,3}																Code Ref.
		1/2" Dia. Anchors at				5/8" Dia. Anchors at				(2)-5/8" Dia. Anchors at				3/4" Dia. Anchors at				
		12"	24"	36"	48"	O.C.	O.C.	12"	24"	36"	48"	O.C.	O.C.	12"	24"	36"	48"	O.C.
Wood	8-ICF-D3.62	1940	1905															
Steel	4-1/4x3/4 ³	1660	1525															

1. The Designer may specify different spacing based on the load requirements.
2. Spacings are based on perpendicular to grain capacity of bolt in wood ledger compared to tested value of ICFVL.
Additional connectors required for out-of-plane loads.
3. See flier F-ICFVL for additional connection details.
4. For steel ledgers, the 68 mil ledger spacing is closer than the 54 mil ledger because the calculated load of a bolt is higher in a thicker piece of steel.
5. Steel ledger values are based on steel. $F_u = 60$ ksi.
6. Maximum ICF foam thickness is 2 3/4".

Typical Wood Ledger Installation
with ICFVL and ICFVL-W

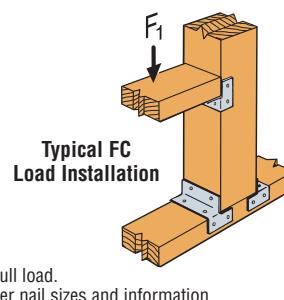

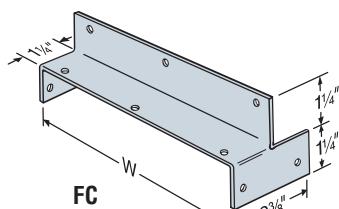

Requires 4 screws
at each location.
Table provides on
center spacing.

Miscellaneous

FC Framing Clips

For fast, accurate framing. Three-dimensional nailing pattern results in high-strength joint values. Ideal for fence construction.
MATERIAL: 16 gauge **FINISH:** Galvanized
INSTALLATION: Use all specified fasteners. See General Notes.
CODES: See page 12 for Code Reference Key Chart.

Model No.	W	Fasteners	Allowable F ₁ Loads (100)	Code Ref.
FC4	3 1/16"	8-16d	865	IP1, L18, F13
FC6	5 1/2"	10-16d	1010	

1. Loads may not be increased for short-term loading.
2. A 2 1/2" minimum lumber thickness is required to achieve the full load.
3. **NAILS:** 16d = 0.162" dia. x 3 1/2" long. See pages 22-23 for other nail sizes and information.

BT Brick Ties

Brick Ties provide a connection between the wood structure and brick façade.

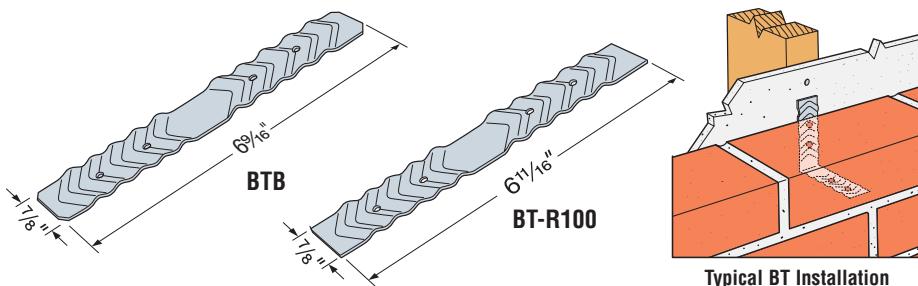

MATERIAL: 22 gauge
FINISH: Galvanized, available in Type 304 stainless steel (*order as BTBSS*).

INSTALLATION:

- Holes sized for 10d commons.
- See code for spacing requirements.

CODES: IRC 2009/2012, R703.7.4

TO ORDER: BT-R100 = retail pack of 100
 BTB = bulk carton of 500

Typical BT Installation

MP Mending Plates

Versatile and easy-to-use mending plates for wood-to-wood connections. No nails or notching of wood required. For non-structural applications only; not for truss applications.

MATERIAL: 20 gauge **FINISH:** Galvanized

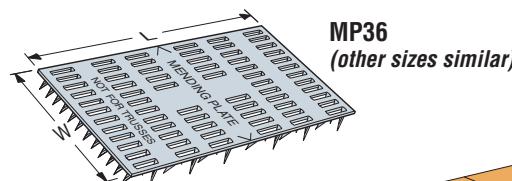

INSTALLATION:

- Place plate over two pieces of aligned wood with arrows aligned at joint.
- Hammer the plate to embed the prongs.

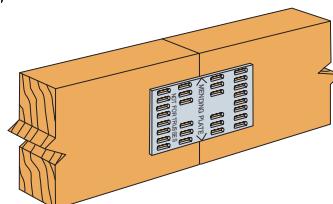

CODES: See page 12 for Code Reference Key Chart.

Model No.	Dimensions		Code Ref.
	W	L	
MP14	1	4	180
MP24	2	4	
MP36	3	6	

1. Connectors are not load rated.

Typical MP Installation

TP/TPA Tie Plates

TPs are nail-on tie plates. TPAs are flanged for added support.

MATERIAL: 20 gauge **FINISH:** Galvanized

INSTALLATION:

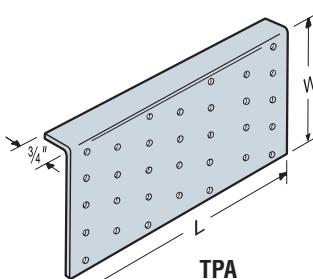

- Holes are sized for 8d common or 8dx1 1/2" nails.

CODES: See page 12 for Code Reference Key Chart.

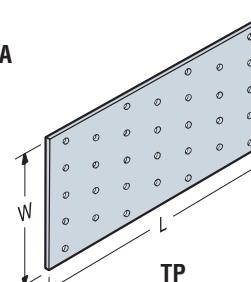

These products are approved for installation with the Strong-Drive® SD Connector screw. See page 27 for more information.

ARCHITECTURAL PRODUCTS GROUP

The **Architectural Products Group** consists of aesthetically pleasing, pre-finished connectors and innovative concealed joist ties designed for exposed wood applications. These connectors provide structural performance and, at the same time, add a unique appearance feature to a project. Refer to Simpson Strong-Tie® C-APG catalog.

• ARCHITECTURAL FINISHES

Eliminate time consuming prep work and costly field painting. Available finishes include textured flat black powder-coat, gray paint and hot-dip galvanized coating.

• AVAILABILITY

Select products are in stock and readily available. Contact Simpson Strong-Tie for product availability and lead times for non-stocked items.

• PRE-ENGINEERED AND TESTED

Load-rated products are verified to perform to design loads, unlike custom designed and fabricated connectors.

• QUALITY ASSURANCE

No-Equal quality-controlled manufacturing ensures product consistency and high quality.

Products shown in this section come with textured flat black powder-coat unless otherwise noted. Most are also available with a galvanized coating or gray primer. Contact Simpson Strong-Tie for availability.

www.strongtie.com/app

BP – BEARING PLATES

Bearing plates give greater bearing surface than standard cut washers, and help distribute the load at these critical connections.

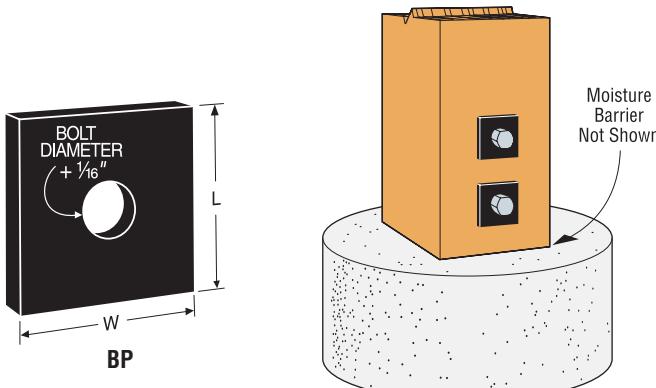

MATERIAL: See table

FINISH: Textured flat black powder-coat

INSTALLATION: See General Notes.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Thickness (in.)	Dimensions		Bolt Dia. (in.)	Code Ref.

Typical BP Installation

SPECIAL ORDER PARTS

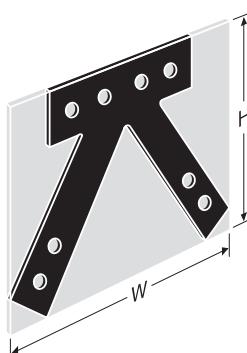

Simpson Strong-Tie can make a variety of flat and bent steel shapes, which include gusset plates for heavy timber trusses, custom ornamental shapes and retaining plates.

MATERIAL: 3 gauge maximum

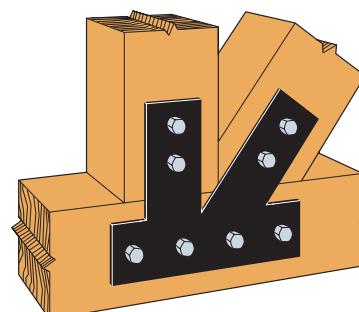

FINISH: Galvanized, textured powder-coated flat black, Simpson Strong-Tie® gray paint, stainless steel. Contact Simpson Strong-Tie for availability.

TO OBTAIN A QUOTE:

- Supply a CAD drawing in .dxf format complete with plate dimensions, hole diameter and locations, steel thickness, desired finish (Simpson Strong-Tie Gray Paint, Black Powder-Coat, HDG or raw steel).
- Total plate shape and size up to maximum dimensions of 48" x 48" (approx. 1/8" tolerance).
- Simpson Strong-Tie does not provide product engineering or load values for special order plates.
- Contact Simpson Strong-Tie for pricing information.
- Refer to General Notes, note g on page 16 for additional information.

"W" and "H" indicate the envelope size of the steel shape.

Typical Installation
(Plate shown has black powder-coat)

ARCHITECTURAL PRODUCTS GROUP

CONCEALED JOIST TIES

The CJT is a concealed connector. It can be installed three ways: with no routing of header/post or beam; a routed header/post, or a routed beam.

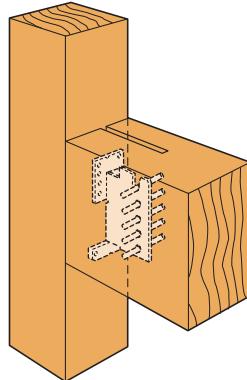

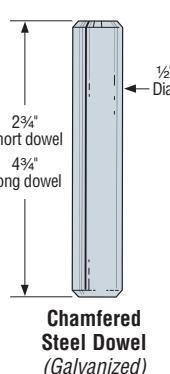

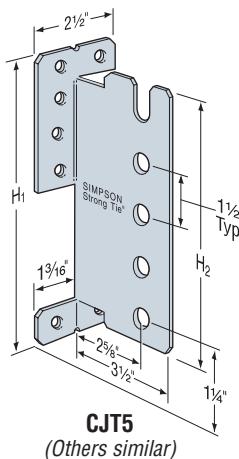

MATERIAL: 12 gauge **FINISH:** Galvanized
INSTALLATION: • Use all specified fasteners.

See General Notes.

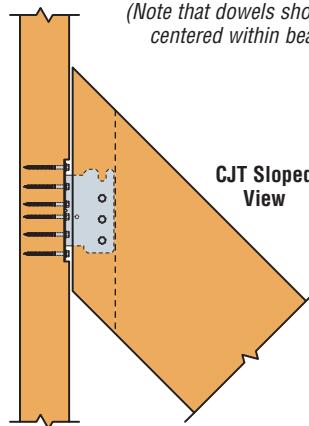

- The CJT Pack is supplied with all dowels and screws required. Screws require a hex head driver.
- Router end of beam for screw heads for flush installation.
- The carried member may be sloped up or down to 45° with full table loads.
- To provide maximum beam width for use with short dowels, center in beam.
- To order: specify short (e.g. CJT3S) or long dowels (e.g. CJT3L) (see footnote #1 below).

OPTIONS: See technical bulletin T-CJT.

CODES: See page 12 for Code Reference Key Chart.

Typical CJT Installation
(Note that dowels should be centered within beam)

- Center dowel in beam. Short dowel (1/2" x 2 3/4") for use with 3 1/8" glulam beam, 4x sawn lumber, or 3 1/2" wide PSL.
 Long dowel (1/2" x 4 3/4") for use with 5 1/8" glulam beam, 6x sawn lumber or greater widths.
- See technical bulletin T-CJT for additional load information with long dowels.

WARNING:
 This connector requires special attention to ensure correct installation. The beam must be installed perpendicular to the support member. The connection's components may be damaged if the beam is rotated from its opposite end during or after installation. Damaged components may not be noticeable and may reduce the connector's load carrying capacity.

ORNAMENTAL – JOIST HANGER

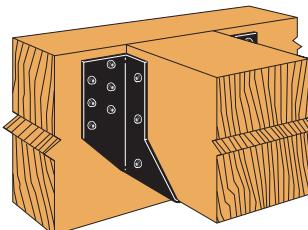

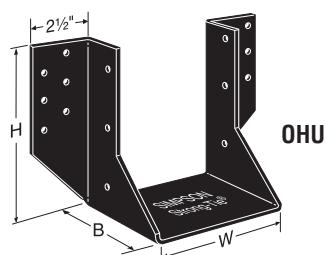

The OHU Ornamental Joist Hangers are heavy duty, load-rated joist hangers that are attached with Simpson Strong-Tie® Strong-Drive® 1/4"x3" double-barrier coating SDS Heavy-Duty Connector screws (supplied with product).

MATERIAL: 12 gauge

FINISH: Textured powder-coated flat black paint.

OPTIONS: No modifications.

CODES: See page 12 for Code Reference Key Chart.

PS418PC	7	4	18	4	3/4		
PS720PC	7	6½	20	8	1/2	4685	

1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. Allowable loads are based on parallel-to-grain loading and a minimum member thickness of 3½" with machine bolts in single shear. Straps must be centered about splice joint and bolt edge distances must meet NDS minimum requirements.

3. Designer must determine allowable loads when combining bolts parallel and perpendicular to grain.

BEAM-TO-COLUMN TIES

Model No.	Ga	Dimensions			Minimum Bolt End & Edge Distances		Bolts		Allowable Loads ^{1,2}		Code Ref.
		W	H	L	d ₁	d ₂	Qty	Dia	Tension/Uplift	F ₁

1616HTPC	7	2½	16	16	2½	4%	6	5/8	2585	815	

1. 1212HL, 1616HL, 1212HT and 1616HT are to be installed in pairs with machine bolts in double shear. A single part with machine bolts in single shear is not load-rated.

2. Allowable loads are based on a minimum member thickness of 3½".

3. 1212HT, 1616HT loads assume a continuous beam.

COLUMN BASES

Model No.	Ga	Dimensions		Bolts		Allowable Tension Loads (160)	Code Ref.

CB88PC	3	7½	7½	2	3/4		
CB810PC	3	7½	9½	2	3/4	6650	

1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. See page 60 for glulam beam sizes. Add PC to the model, i.e. CB5-6PC.

3. Minimum side cover for full loads is 3" for CBs.

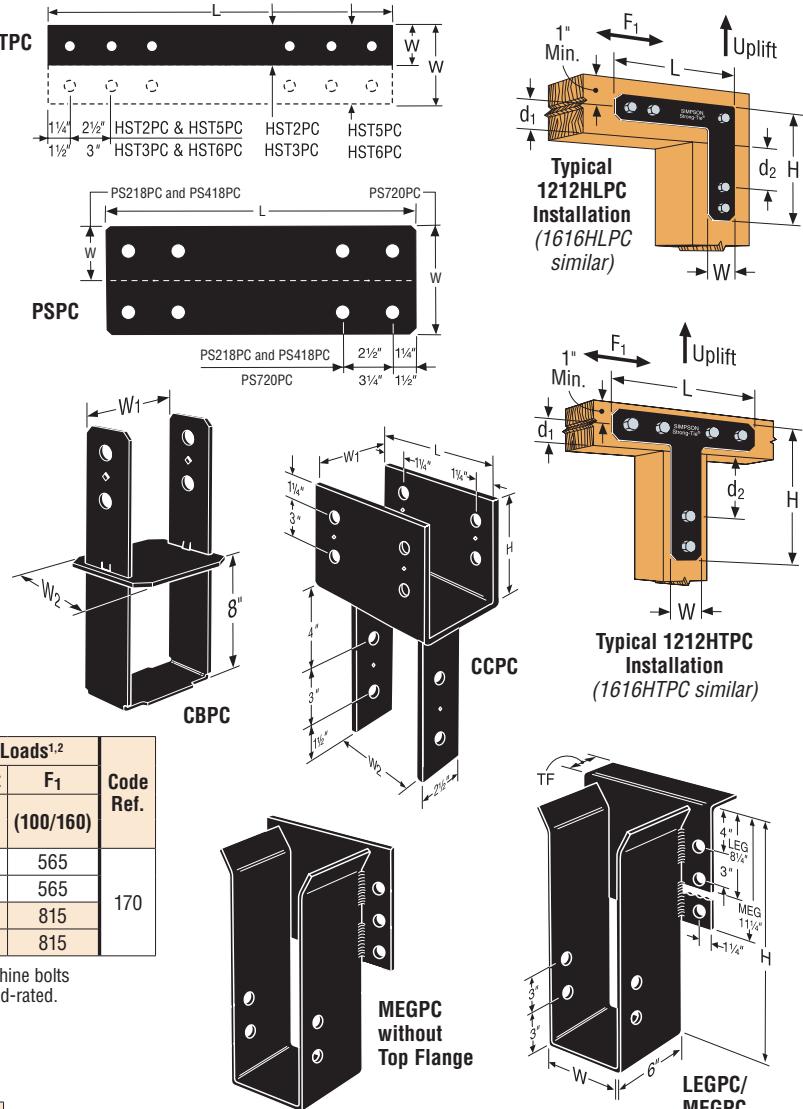

4. Install with bottom of base flush with concrete.

5. Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).

CC88PC	3	7½	7½	13	8	4	3/4	2	3/4	7440	54600

1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

2. Post sides are assumed to lie in the same vertical plane as the beam sides.

3. Downloads are determined using F_c per perpendicular equal to 625 psi on seat area; reduce where end bearing value of post, L/R of post, or other criteria are limiting.

4. See page 60 for glulam beam sizes and end conditions. Add PC to the model, i.e. CC3½-4PC.

5. Column caps for end conditions available to order, add an "E" to the start of the model number. See page 69 for load values.

- Allowable loads assume a 5½" carrying member.
- Specify desired height, minimum height listed in the table.
- Glulam widths listed in table. To specify other widths add an X to the name and specify.
- See Glulam Connectors section of this catalog for additional information on these products.
- Refer to page 104 footnote #4 for triangle theory explanation.

ARCHITECTURAL PRODUCTS GROUP

RUSTIC COLLECTION

MATERIAL: As noted in tables

FINISH: Textured powder-coated flat black paint

INSTALLATION: • Use all specified fasteners. See General Notes.

OU812	7	7 1/2	11	6-3/4	3-3/4	2050	3815	4765	
OU814	7	7 1/2	13	6-3/4	3-3/4	2050	3815	4765	

1. Load values allowed assume a carrying member of not less than 3 1/2".

2. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for other load durations according to the code provided they do not exceed those in the roof column.

3. Additional glulam beam widths are available. Add an "X" to the name and specify width, i.e. OU68X, W = 5.25.

4. Skew and slope options not available.

ARCHITECTURAL PRODUCTS GROUP

STANDOFF BASES

The **PBV** is a hidden standoff post base. Two different sizes fit a variety of posts shapes.

MATERIAL: 14 gauge galvanized steel

FINISH: Textured powder-coated flat black paint or galvanized

ORDER: For powder-coated flat black, order PBV6PC or PBV10PC.

For galvanized coating, order PBV6 or PBV10. For kit containing Simpson Strong-Tie® Strong-Drive® SDS Heavy-Duty Connector screws, RFB bolt, SET® Epoxy Anchoring adhesive, and powder-coated PBV, order PBV6KT or PBV10KT.

The **CPS** is a Composite Plastic Standoff designed for increased concrete surface area.

MATERIAL: Engineered composite plastic

INSTALLATION: PBV and CPS

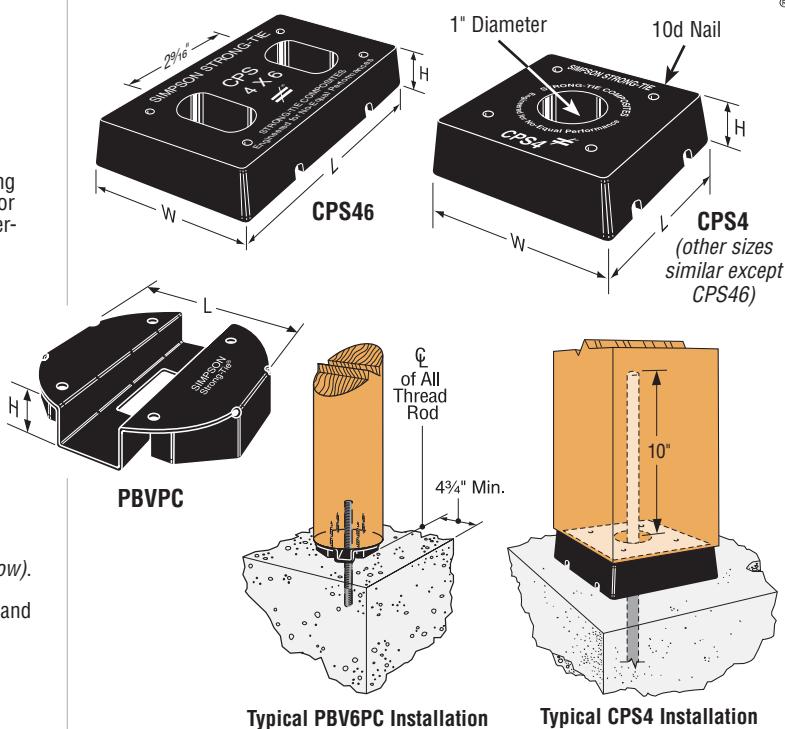

Post:

- Drill a $\frac{3}{4}$ " diameter hole, 10" into the center of the post.
- Clean out dust. Fill hole halfway with Simpson Strong-Tie® SET Epoxy Anchoring adhesive.
- Insert all-thread rod and allow epoxy to set and cure.
- Secure standoff to post using four 10d nails except PBV which uses four Simpson Strong-Tie Strong-Drive SDS Heavy-Duty Connector screws.

Concrete:

- Drill a $\frac{3}{4}$ " diameter hole per anchor design (see footnote 2 below).
- Clean out dust. Fill hole halfway with Simpson Strong-Tie SET Epoxy Anchoring adhesive. Insert post subassembly into hole and allow epoxy to set and cure.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).

CODES: See page 12 for Code Reference Key Chart.

Model No.	Post or Column Size	Dimensions			Fasteners		Allowable Loads		Code Ref.
		L	W	H	Post	Anchor Bolt	Uplift	Down ³

PBV10PC	10" Dia	9 9/16	—	1	4-SDS 1/4x3	5/8"	3800	19225	

1. Allowable uplift load capacities are for solid sawn posts with specific gravity of 0.36 minimum except the PBV, which is based on round "Viga" (Ponderosa Pine) wood posts.
 2. All allowable uplift loads are based on a lowest ultimate load from testing divided by a safety factor of 4. Concrete anchorage to be designed by others, refer to Simpson Strong-Tie® Anchoring and Fastening Systems for Concrete and Masonry catalog (form C-SAS). Allowable uplift capacities shall not exceed those shown in the table.
 3. Download capacities are calculated based on the standoff bearing area and a concrete strength of 2500 psi except the PBV, which is based on the wood bearing strength (700 psi for Ponderosa Pine).
 4. Allowable loads may not be increased for short term loading.
 5. NAILS: 10d = 0.148" dia. x 3" long.
- See pages 22-23 for other nail sizes and information.

HL – HEAVY ANGLES & GUSSETS

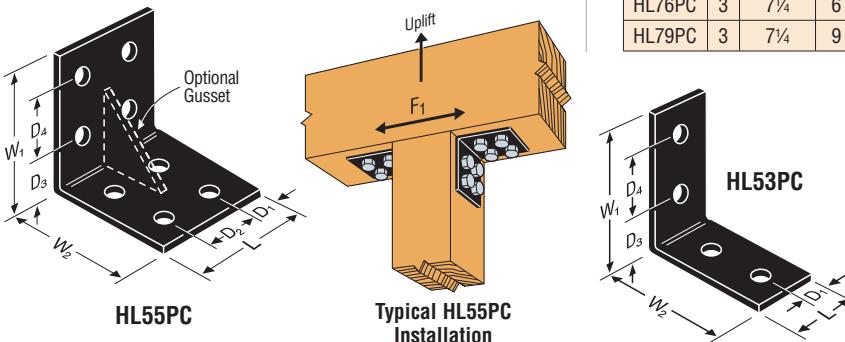

Versatile angle gussets and heavy angles promote standardization and construction economy, and are compatible with Simpson Strong-Tie® structural hardware.

FINISH: Textured powder-coated flat black paint, Simpson Strong-Tie® gray paint and also available galvanized

TO ORDER: All products with PC suffix are textured powder-coated flat black paint. 7 gauge products without the PC suffix are galvanized. 3 gauge products without the PC suffix are Simpson Strong-Tie gray paint.

OPTIONS: Gussets may be added to HL models when $L \geq 5"$. Specify G after numbers in model number as in HL46GPC.

CODES: See page 12 for Code Reference Key Chart.

HL79PC	3	7 1/4	9	1 1/2	3	2 3/4	3	12	3/4	2115	3800	

1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
2. Use 0.85 times table load for Hem Fir.
3. Parts should be centered on the face of the member to which they are attached.
4. Wood members for the '3' and '5' series must have a minimum width and thickness of 3 1/2" for table loads to apply.
5. Wood members for the '4' and '7' series must have a minimum width and thickness of 5 1/8" for table loads to apply.
6. Parts must be used in pairs. Lag bolts of equal diameter (minimum 5" long) may be substituted for machine bolts into beam with no reduction in load.

HANGER OPTIONS GENERAL NOTES

The Hanger Options Matrix for Face Mount and Top Flange Hangers on pages 234-235 shows hanger modifications and special applications (*uplift, nailers and weldability*) that are available for each model series. Modifications may not be available for all models in the series, and some combinations of hanger options are not available. Many hanger modifications result in load reductions. For all modifications, refer to the listed hanger option pages for additional information regarding the availability of each modification, associated load reductions, and installation requirements. For more information regarding the applications, refer to the individual product pages throughout the catalog.

HANGER OPTIONS GENERAL NOTES

This information applies only to the hangers manufactured by Simpson Strong-Tie and installed per our instructions. Some combinations of these options on a single hanger have not been evaluated. In some cases, combinations of these options cannot be manufactured. A qualified Designer must always evaluate each connection, including header and joist limitations, before specifying the product.

Testing is performed using a standardized hanger test method. The joist in the test setup may include the minimum amount of structural stability where appropriate. For example, the sloped down hanger tests are assembled with a joist cut on the lower end to lie flush with a wood member attached with three 8d common toenails. Header and other attached structural members are assumed fixed in actual installations. Horizontal loads induced by sloped joists must be resisted by other members in the structural system.

MATERIAL: Gauge may vary from that specified depending on the manufacturing process used. U, HU, HUTF, W and B hangers normally have single-piece stirrups; occasionally, the seat may be welded. Hanger configurations, height and fastener schedules may vary from the tables depending on the joist size, skew and slope.

FINISH: See specific hanger tables. Welded specials: Simpson Strong-Tie® gray paint.

Specials that are not galvanized before fabrication can be hot-dip galvanized after fabrication; specify HDG.

CODES: Modified hangers, due to their numerous variations, are not on code reports.

LOADS: For multiple modifications on the same connector, use the single multiplier factor that yields the lowest design loads.

TO ORDER: Use the abbreviations below to order specials. The example shows a W410 hanger and illustrates most available options; most special hangers have only a few of these features. For assistance, contact Simpson Strong-Tie.

INSTALLATION:

- Fastener quantities may be increased beyond the amount specified in the standard hanger table.
- Fill all holes with the table-specified fastener types.
- Some skewed hangers require bevel cut joists; refer to the specific notes provided for each product.

W410	X	SLD30	SKL20	TFDL20	TFO20	OSR
Base Model		Seat Sloped Down (30°) (SLU = Seat Up)	Skewed Left (20°) (SKR = Skewed Right)	Top Flange Down Left (20°) (TFDR = Top Flange Down Right)	Top Flange Open (20°) (TFC = Top Flange Closed)	Offset Top Flange Right (OSL = Offset Top Flange Left)
	X = Modification					

The new Joist Hanger Selector software enables you the most optimum product for your project. The software takes into consideration all the characteristics seen in this catalog. Visit www.strongtie.com/jhs.

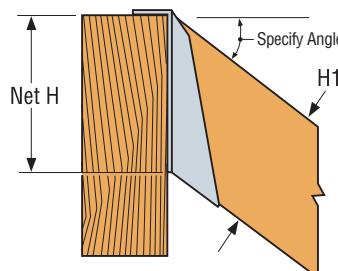

HEIGHT FOR SLOPED HANGERS

Height 1 (H1) is the joist height before the slope cut has been made.

Net Height (Net H) is the joist height after the slope cut has been made.

Provide **H1** when ordering a connector. Connectors are made assuming dry lumber is being used in continuously dry conditions.

Simpson Strong-Tie will calculate the **Net H** dimension based on the mathematical formula of $H1/\cos \text{angle}$.

- Refer to the specific product pages for uplift, nailer, and weld information.
- Refer to the listed pages for each model series for restrictions, required load reductions, and additional information regarding the hanger modifications.
- HUC less than 3 1/4" wide cannot be skewed 45°. See page 236 for allowable skews for narrower widths.
- Square cut allowed for beams up to 5 1/2" and 4-ply trusses.

HANGER OPTIONS

U/HU

See Hanger Options General Notes.

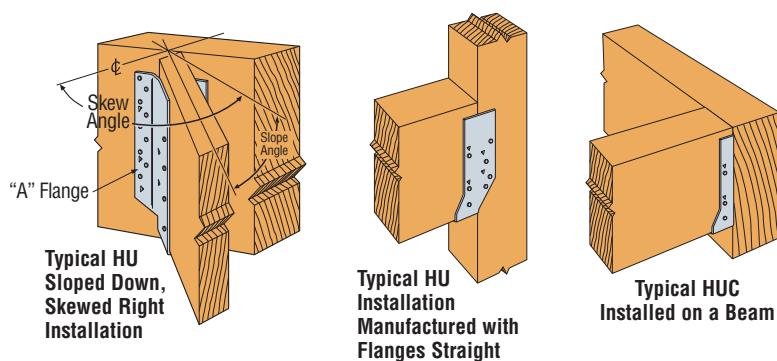

Not all slope and skew combinations are available.

SLOPED, SKEWED, AND SLOPED/SKEWED

- For low-cost, code-reported 45° skews, see SUR/SUL and HSUR/HSUL. See also LSU/LSSU connectors.
- These options only apply to wood-to-wood connections.
- U/HU may be skewed to a maximum of 45° and sloped to a maximum of 45°. Hangers 5½" or less in width may be skewed to 67½°. Hangers skewed 51°-67½° require a square cut.
- For all options, uplift loads are 0.75 of table loads.
- For skewed hangers 3½" and less in width, the allowable download is 100% of the table load. For skewed hangers over 3½" in width the allowable download is 80% of the table load. For slope only, the allowable download is 100% of the table load.
- For combined slopes and skews, the maximum allowable download is 0.80 of the table load.
- Skewed hangers may have joist nails only on one side.

STRAIGHT OR CONCEALED FLANGE

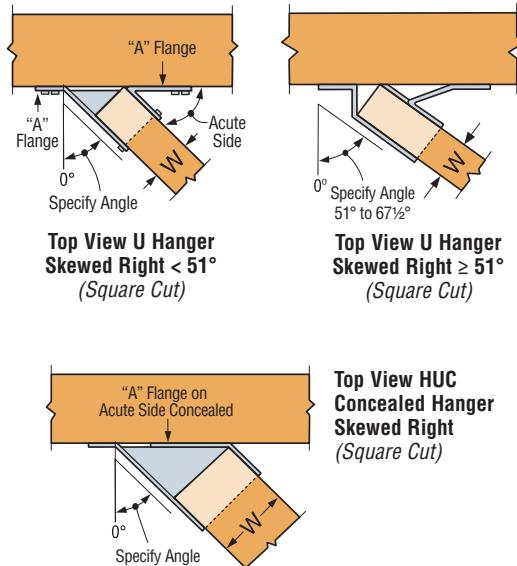

- HU is available with the A flanges straight at 100% of the table loads if $W \geq 3\frac{1}{2}$ ".
 - If $W < 3"$, use N10 nails at 0.64 of the table load.
 - If $W \geq 3"$, use 10d nails at 0.84 of the table load.
- HU is available with A flanges concealed, provided the W dimension is 2½" or greater, at 100% of the table load. Specify HUC.
- HU is available with one flange concealed when the W dimension is less than 2½" at 100% of the table load.
- For skewed only HUC hangers, the flange on the acute side can be concealed at 100% of the table load. See table for skew limitations.
- For sloped only hangers, flanges can be concealed at 100% of the table load.
- For sloped and skewed hangers, the flange on the acute side can be concealed at 0.80 of the table load. Contact Simpson Strong-Tie for skew limitations.
- When nailing into the carrying member's end grain, the allowable load is 0.67 of the table load.
- For welding see technical bulletin T-HUHUC-W.

Maximum Skew Degree for Skewed HUC Hangers

Hanger Width (in.)	Maximum Skew (degree)
2½	31
2¾	31
2½	34
2¾	37
3½	41
3¼	42

1. Widths greater than 4½" maximum skew is 45°.

WM/WMI/WMU

See Hanger Options General Notes.

INSTALLATION: • Bevel-cut the joist for skewed hangers (*see illustration*).

HANGER HEIGHT

- For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.

SLOPED AND/OR SKEwed SEAT

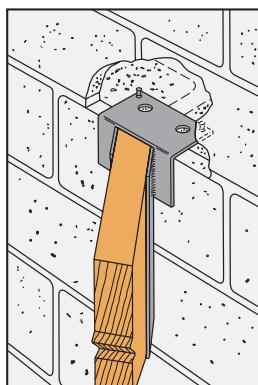

- WM/WMI may be skewed and/or sloped to 45° maximum.
- The allowable load is 100% of the table load.

OFFSET TOP FLANGE

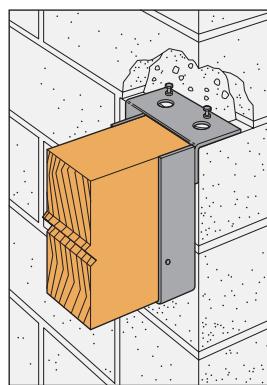

- The top flange may be offset left or right for placement at the end of a header. The allowable load is 0.50 of the table roof load.

UPLIFT (WMU Only)

- No modifications on WMU.

Typical WM Sloped Down, Skewed Right Block Wall Installation

Typical WM Top Flange Offset Left

HANGER OPTIONS

HTU

See Hanger Options General Notes.

SKewed SEAT

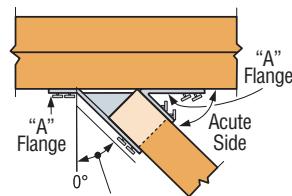

- Skewable up to $67\frac{1}{2}^\circ$.
- Available in single and 2-ply size.
- No bevel cut required.

Allowable Loads for Skewed HTU Hangers

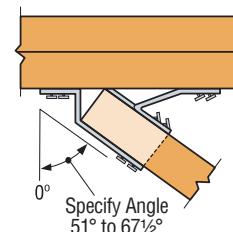

Model No.	Skew Angle (Degree)	Fasteners		DFL/SP Allowable Loads ^{1,2}		HF/SPF Allowable Loads ^{1,2}	
		Carrying Member	Carried Member	Uplift (133/160)	Download (100/115/125)	Uplift (133/160)	Download (100/115/125)

	51-67½	32-16d	22-10d	2255	4790	1940	4120

- Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.
- Allowable downloads may not be increased.

- Maximum hanger gap between end of joist (truss) and face of carrying member is $\frac{1}{8}''$.
- NAILS:** 16d = $0.162''$ dia. $\times 3\frac{1}{2}''$ long, 10dx1½ = $0.148''$ dia. $\times 1\frac{1}{2}''$ long, 10d = $0.148''$ dia. $\times 3''$ long. See pages 22-23 for other nail sizes and information.

Top View HTU Hanger Skewed Right $< 51^\circ$

Top View HTU Hanger Skewed Right $\geq 51^\circ$

HGUS/HHUS

See Hanger Options General Notes.

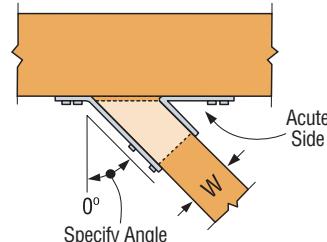

HHUS – SLOPED AND/OR SKewed SEAT

- HHUS hangers can be skewed to a maximum of 45° and/or sloped to a maximum of 45° .
- For skew only, maximum allowable download is 0.85 of the table load.
- For sloped only or sloped and skewed hangers, the maximum allowable download is 0.65 of the table load.
- Uplift loads for sloped/skewed conditions are 0.72 of the table load, not to exceed 2475 lbs.
- The joist must be bevel-cut to allow for double shear nailing.

HGUS – SKewed SEAT

- HGUS hangers can be skewed only to a maximum of 45° . Allowable loads are:

HGUS Seat Width	Joist	Down Load	Uplift
$W < 2''$	square cut	0.62 of table load	0.46 of table load
$W < 2''$	bevel cut	0.72 of table load	0.46 of table load
$2'' < W < 6''$	bevel cut	0.85 of table load	0.41 of table load
$2'' < W < 6''$	square cut	0.46 of table load	0.41 of table load
$W > 6''$	bevel cut	0.85 of table load	0.41 of table load

Top View HHUS Hanger Skewed Right
(joist must be bevel cut)

All joist nails installed on the outside angle (non-acute side).

THJU

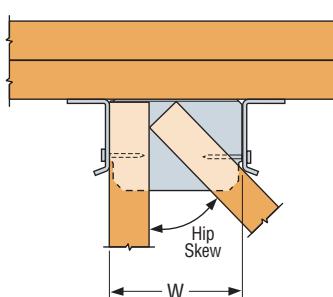

See Hanger Options General Notes.

HANGER WIDTHS

- THJU is available in intermediate seat widths between $5\frac{1}{8}''$ (*THJU26 width*) and $8\frac{1}{8}''$ (*THJU26-W width*).
- Allowable download and uplift for all intermediate widths is 100% of the *THJU26-W* table loads.
- For double hip installation, divide the total allowable load by 2 to determine the allowable load for each hip.
- Order as *THJU26X* and specify width; see table for reference.

THJU Intermediate Width Options

Carried Member Combination	Hip Skew	Width (W)
2-Ply Hip and Single-Ply Jack	45°	$6\frac{1}{8}$
Single-Ply Hip and 2-Ply Jack	45°	$6\frac{3}{4}$
Double (Terminal) Hip	45°	$7\frac{1}{8}$
2-Ply Hip and 2-Ply Jack	45°	Use <i>THJU26-W</i>
	$44^\circ - 46^\circ$	Use <i>THJU26</i>
	$47^\circ - 49^\circ$	$5\frac{1}{2}$
	$50^\circ - 52^\circ$	$5\frac{3}{4}$
Single-Ply Hip and Single-Ply Jack	$53^\circ - 55^\circ$	6
	$56^\circ - 57^\circ$	$6\frac{1}{8}$
	$58^\circ - 59^\circ$	$6\frac{3}{4}$
	$60^\circ - 61^\circ$	7
	$62^\circ - 63^\circ$	$7\frac{1}{8}$
	$64^\circ - 65^\circ$	Use <i>THJU26-W</i>

THJU Top View Installation

HANGER OPTIONS

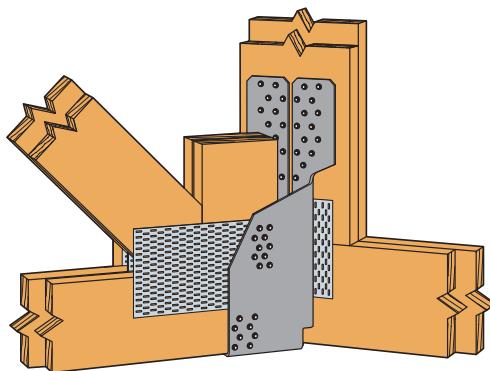

THGQH

See Hanger Options General Notes.

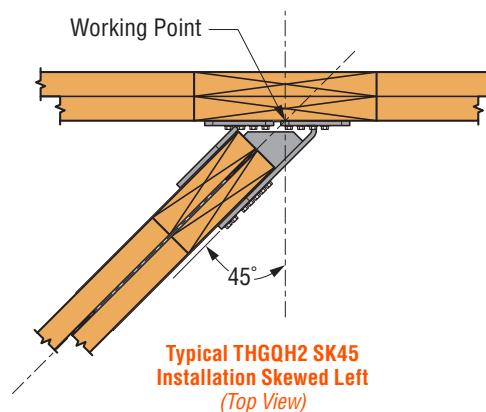

SKEWED SEAT

- THGQH may be skewed 45° for the models shown. Carried members may be bevel cut.
- For Hem-Fir or Spruce-Pine-Fir members, multiply tabulated allowable loads for the skewed THGQH by 0.86. Connector must be installed centered on girder vertical webs.

Model #	Max. B.C. Depth (in.)	Min. Vertical Web Size	Fasteners		DF/SP Allowable Loads	
			Face	Joist	Uplift (160)	Down (100/115/125)
THGQH2 SK45	17	2x6	18-1/4" x 3" SDS	18-1/4" x 3" SDS	4570	6090
		2x8	28-1/4" x 3" SDS			9470
THGQH3 SK45	14	2x8	30-1/4" x 4 1/2" SDS	18-1/4" x 4 1/2" SDS	3875	10270
		2x10	36-1/4" x 4 1/2" SDS			12480
THGQH4 SK45	13	2x8	34-1/4" x 6" SDS	18-1/4" x 6" SDS	3180	11890
		2x10	40-1/4" x 6" SDS			13990

Typical THGQH2 SK45
Installation Skewed Left

Typical THGQH2 SK45
Installation Skewed Left
(Top View)

THGB/THGBH/THGBV/THGBHV

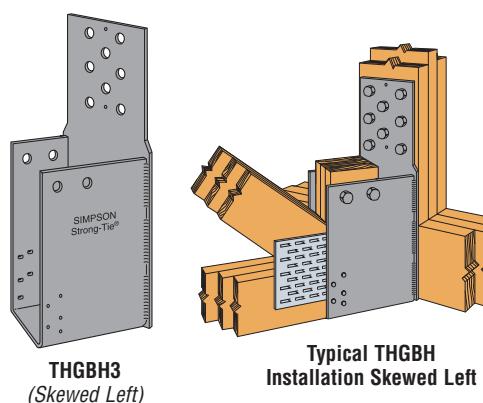

See Hanger Options General Notes.

SKEWED SEAT

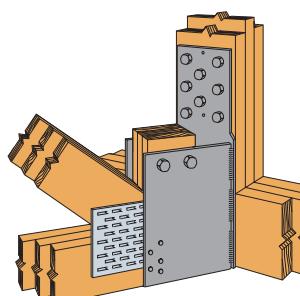

- THGB/THGBH/THGBV/THGBHV hangers can be skewed to a maximum of 45°.
- The maximum allowable down load and uplift load for skew is 0.87 of the table load.

DROPPED BUCKET

- THGBV/THGBHV backplates can be extended to allow for up to a 6" dropped bucket.
- Allowable loads are 100% of the table loads.
- Order as "X" version, specify the total backplate height, BK_PLT, equal to the hanger height (H) plus the dropped bucket amount (db). Ex: a THGBV3.62/9 with a 4" dropped bucket would have a total backplate height of 27 1/4".

THGBH3
(Skewed Left)

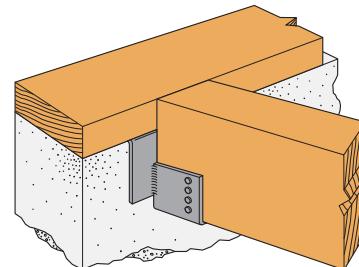

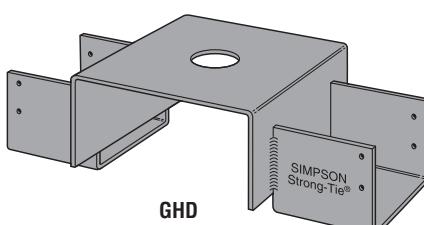

Typical THGBH
Installation Skewed Left

GH Girder Hanger

See Hanger Options General Notes.

SKEWED SEAT

- GH hangers may be skewed to a maximum of 45°; bevel cut required.
- The allowable loads are 100% of the table load.
- Specify GHD for saddle-style hangers. GHD may not be skewed.

Typical GH Installation
Skewed Right

HANGER OPTIONS

GLT/HGLT/GLS/HGLS/GLTV/HGLTV

See Hanger Options General Notes.

INSTALLATION: • Bevel-cut the carried beam for skewed hangers.

HANGER HEIGHT

- For hangers exceeding the joist height by $\frac{1}{2}$ ", allowable load is 50% of the table roof load.

SLOPED AND/OR SKEWED SEAT

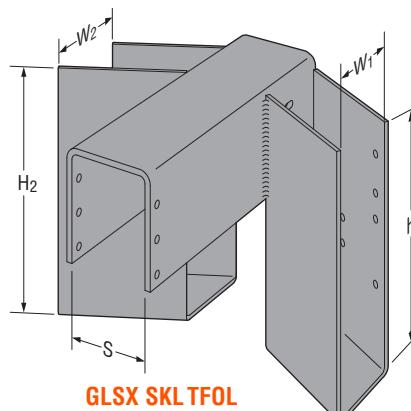

- GLT/GLTV/HGLT/HGLTV and GLS/HGLS series may be skewed to a maximum of 50° or sloped to a maximum of 45°.
- For skews greater than 15°, multiply the table uplift load by 0.50.
- For sloped only, the maximum allowable load is 6500 lbs. for the GLT/GLS/GLTV, 9165 lbs. for the HGLT/HGLS/HGLTV.
- For skewed only, the maximum allowable load is 6550 lbs. for the GLT/GLS/GLTV, 7980 lbs. for the HGLT/HGLS/HGLTV. The deflection at full loading may reach $\frac{1}{4}$ ".
- Sloped and skewed GLT/GLS/GLTV configurations have a maximum allowable load of 5500 lbs. Sloped and skewed combinations are not allowed for the HGLT/HGLS/HGLTV.
- Sloped and/or skewed seat hangers may not be installed in non-backed nailer/header installations.

SLOPED TOP FLANGE

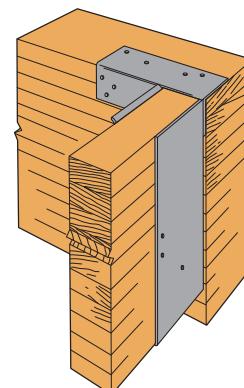

- A top flange may be sloped down left or down right to 30° with or without a sloped and/or skewed seat (see illustration). Reduce allowable table loads using straight-line interpolation (see page 241).

OFFSET TOP FLANGE

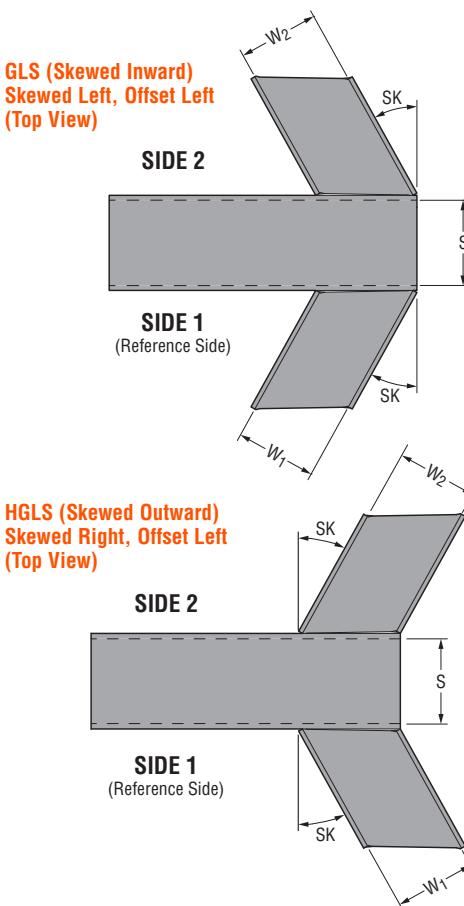

- The top flange may be offset left or right for placement at the end of a header. Minimum seat width $3\frac{1}{4}$ ". The maximum allowable load is 0.50 of the table load for the GLT/GLS/GLTV, and 0.45 for the HGLT/HGLS/HGLTV.
- For skewed and offset top-flange GLS/GLT/GLTV hangers with inward configuration, the maximum allowable load is 3,500 lbs. Outward configuration is not allowed.
- For skewed and offset top-flange HGLS/HGLT/HGLTV hangers with inward or outward configuration, the maximum allowable load is the lesser of a) 45% of the catalog load or b) 4,300 lbs.
- No uplift load.

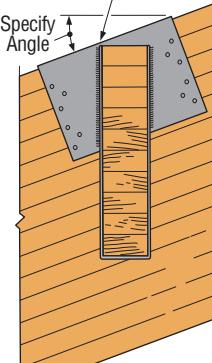

GLSX SKL TFOL

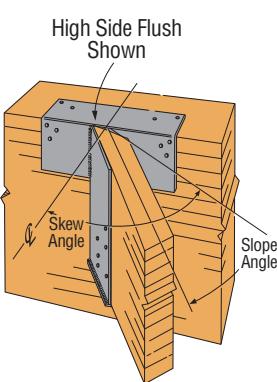

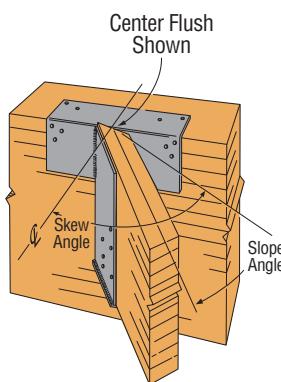

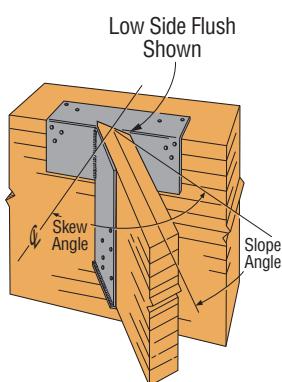

Typical GLT
Top Flange Offset Left

Typical GLT Sloped Down, Skewed Right
When ordering, specify Low Side Flush, Center Flush or High Side Flush

HANGER OPTIONS

B/LBV/HB/HHB/GB/HGB

See Hanger Options General Notes.

MATERIAL:

- Gauge may vary from that specified depending on the manufacturing process used. Hanger configurations, height and fastener schedules may vary from the tables depending on the joist size, skew and slope.

CODES:

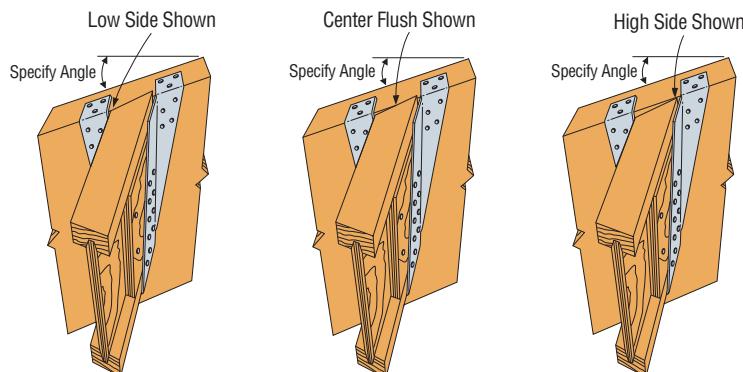

- Modified hangers, due to their numerous variations, are not in code reports.

LOADS:

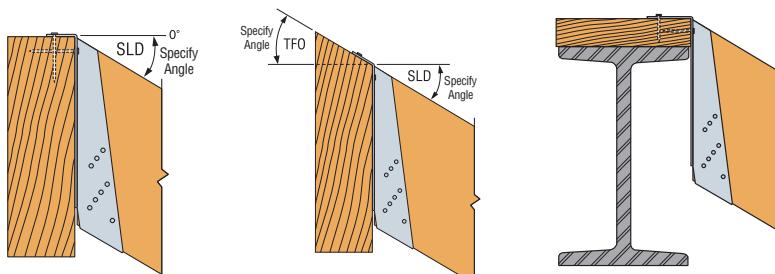

- For multiple modifications on the same connector, use the single multiplier factor that yields the lowest design loads.

INSTALLATION:

- Fastener quantities will typically increase beyond the amount specified in the standard hanger tables.
- Web stiffeners are required for I-joists.
- Fill all holes with the table-specified fastener types.
- Bevel cut the carried member for skewed applications.

B Hanger Sloped Down and Skewed Left with Sloped Top Flange Installation
When ordering, specify Low Side Flush, Center Flush or High Side Flush

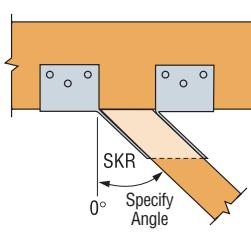

Typical LBV Sloped Down Installation with Full Backing
Typical LBV Sloped Down with Top Flange Open
Typical LBV Sloped Down on Nailer Non-Backed

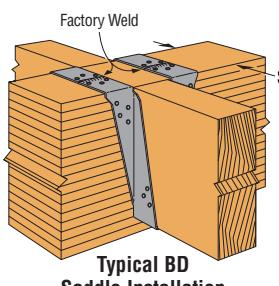

Reduction Factors for Allowable Loads for Modified Hangers¹

Hanger Series	Condition	Carried Member Modifications						Support Member Modifications ⁵	
		Sloped Down	Sloped Up	Skewed Only	Sloped Down & Skewed		Sloped Up & Skewed	Top Flange Down	Top Flange Open/Closed
	Angle Limit		45	45	45	45	45	35	30
LBV	Minimum Height	6	6	6	9 1/4	14	9 1/4	14	11 1/4

	Uplift	1.00	1.00	1.00	1.00	1.00	1.00	1.00	1.00
B	Minimum Height	6	6	6	9 1/4	14	9 1/4	14	14 ⁴
	Less than 2 1/2" Wide ²	Download	0.82	0.66	0.95	0.54	0.82	0.64	(90-x)/90
	Uplift	1.00	1.00	1.00	0.90	1.00	0.90	1.00	1.00
	2 1/2" and Wider ³	Download	0.80	0.95	1.00	0.70	1.00	0.80	(90-x)/90
HB	Minimum Height	8	8	8	11 1/4	14	11 1/4	14	14 ⁴
	Less than 2 1/2" Wide ²	Download	0.84	0.70	1.00	0.47	0.84	0.62	(90-x)/90
	Uplift	1.00	1.00	0.71	0.71	0.71	0.71	1.00	1.00
	2 1/2" and Wider ³	Download	0.87	0.70	0.96	0.59	0.87	0.70	(90-x)/90
HHB GB HGB	Minimum Height	9 1/4	—	—	—	—	—	—	—
	All Widths	Download	0.70	—	—	—	—	—	—
	Uplift	1.00	—	—	—	—	—	—	—

- Use this table to calculate allowable loads for modified hangers. Apply the reduction factor to the appropriate allowable load for the header condition including headers.
- B and HB hangers less than 2 1/2" wide are assumed to use 10dx1 1/2" joist nails.
- B and HB hangers 2 1/2" or wider are assumed to use 16dx2 1/2" or 16d common nails in the joist.
- For B and HB hangers with TF Down that are less than 5 3/8" in width, minimum hanger height is 11 1/4 inches.
- These hangers may deflect an additional 1/2" at design load.
- For HB hangers on nailers, 100% of allowable nailer uplift value may be used. (See nailer table)
- For hangers with slope and skew less than 14° use 1150 lbs. for B hangers and 1430 lbs. for HB hangers.
- In the table the term "x" refers to the angle of the modification.
- For top flange closed option, install upper nails slightly angled downward to avoid interference with top flange.

Top View B Hanger Skewed Right

Typical BD Saddle Installation

SADDLE HANGER

Saddle hangers are made to order; add "D" to model (e.g. BD412); specify S (for saddle) dimension. They may be used for most conditions except at end wall locations and are preferred for nailer applications. Minimum S dimension (saddle width) is 3 3/16". Minimum supporting member width is 3 1/2". Minimum nailer thickness apply (see page 84 and 120). Saddle hangers achieve catalog load listed. Saddle hangers on stud walls do not achieve catalog loads.

HANGER OPTIONS

W/WNP/WNPU/WP/WPU/HW/HWU

See Hanger Options General Notes.

Models that have an "I" in the model number (e.g., HWI) have the same properties and modifications as the standard models without the "I" in the name (e.g., HW).

- INSTALLATION:**
- Some models are available in Type A (*Bevel Cut*) and Type B (*Square Cut*) styles; all models are available in Type B style. Contact Simpson Strong-Tie when ordering.
 - Bevel-cut the joist for skewed Type A hangers (*see illustration*). Butt-cut the joist for Type B hangers.
 - Hangers with a skew greater than 15° may have all the joist nails on the outside angle.
 - Skewed HWs have face nails and require a minimum header depth of 3½".

HANGER HEIGHT

- Minimum height may increase significantly with modification. Check availability when ordering.
- For hanger heights exceeding the joist height by more than ½", the allowable load is 0.50 of the table load.

SLOPED AND/OR SKEwed SEAT

- Non-skewed hangers can carry the design load when the seat slope is within ¼:12 of the joist slope. Designer must check that wood bearing is not limiting.
- W/WNP/WP/HW series may be skewed to a maximum of 84° and/or sloped to a maximum of 45°.
- For slope only, skew only, or slope and skew combinations, the allowable load is 100% of the table load.

UPLIFT LOADS (WPU, WNPU, HWU only)

- Uplift loads not available on W, WNP, WP, HW hangers. See page 236 for WMU.
- Hangers can be sloped to 45° and/or skewed 45° at 100% of the uplift load.
- Skew option is only on hangers with "W" 3 ½" or less.
- Specify the slope up or down in degrees from the horizontal plane and/or the skew right or left in degrees from the perpendicular vertical plane. Specify whether low side, high side or center of joist will be flush with the top of the header (*see illustration*).
- Uplift loads are not available for open/closed TF, TF sloped, and offset options.

SLOPED TOP FLANGE

- A top flange may be ordered sloped down left or down right to 35° with or without a sloped and/or skewed seat (*see illustration*). Reduce allowable table loads using straight-line interpolation Example: For a top flange sloped down 30°, reduce load to [(90-30)/90] x table load.

OFFSET TOP FLANGE

- The top flange may be offset left or right for placement at the end of a header (*see illustration*). The allowable load is 0.50 of the table load.
- For skewed and offset top flange hangers, the maximum allowable load is 0.50 of the table load or 2000 lbs., whichever is lower.
- For type B hangers skewed and top flange offset in the opposite direction, hangers 3 ½" and less wide have allowable load of 25% of the table load or 1335 lbs. whichever is lower, and for hangers wider than 3 ½", the allowable load is 30% of the table load or 1620 lbs. whichever is lower.

OPEN/CLOSED TOP FLANGE

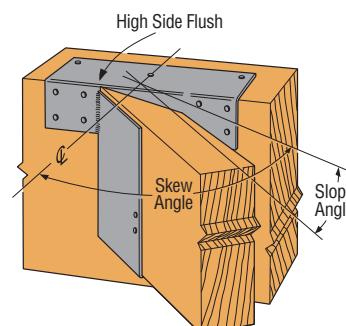

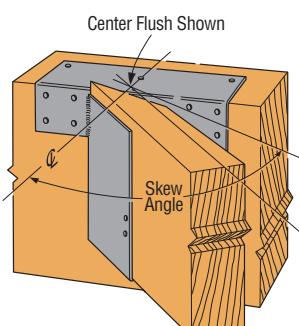

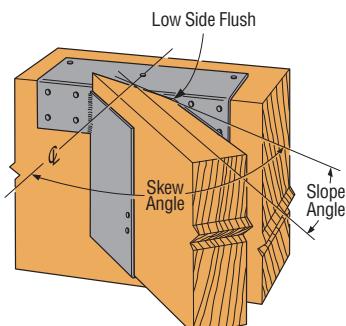

- The top flange may be opened more or closed less than the standard 90° (*see illustration*) to a maximum of 30°, except the HW which cannot be closed. W and WI hangers must use 10d x 1 ½" nails for closed application. Reduce allowable loads using straight-line interpolation (*see sloped top flange*).

SADDLE HANGER

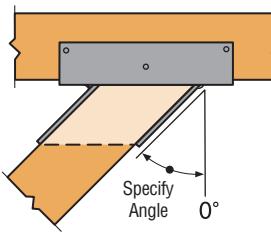

- To order, add D to model and specify S dimension (*see illustration*).
- Saddle hangers achieve catalog load listed. Saddle hangers on stud walls do not achieve catalog loads.
- Recommended S dimension is 1/16" oversized for carrying members 2 ½" wide and less or 1/8" oversized for greater than 2 ½" wide.

RIDGE HANGER (not available for uplift models)

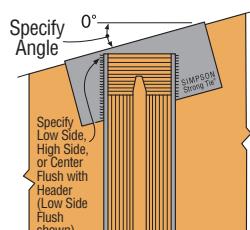

- Top flange may be sloped to a maximum of 35° to accommodate a ridge (*see illustration*). Specify angle of the slope. Reduce allowable load using straight-line interpolation. See Open/Closed example.

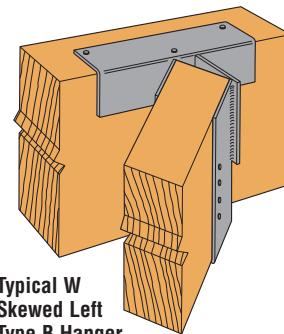

Typical HW Sloped Down, Skewed Right with Type A Hanger (Joist end must be bevel cut)
When ordering, specify Low Side Flush, Center Flush or High Side Flush

HANGER OPTIONS

LEG/MEG/EG

See Hanger Options General Notes.

SKEWED SEAT — TOP FLANGE MODELS ONLY

- The LEG/MEG/EG series can be skewed up to 45°. The maximum allowable load is 10,000 lbs. for LEG and MEG, 14,250 lbs. for EG.

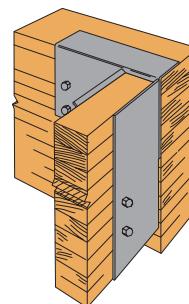

SLOPED SEAT — TOP FLANGE MODELS ONLY

- The LEG/MEG/EG series can be sloped up to 45°. The maximum allowable load is 9665 lbs.; see illustration.

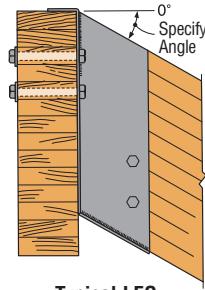

NO SLOPED AND SKEwed COMBO AVAILABLE.

OFFSET TOP FLANGE

- The LEG/MEG (only) top flange may be offset left or right for placement at the end of a header (see illustration). The maximum allowable load is 5665 lbs. (Min. H = 11" for MEG, 9" for LEG)
- No skews allowed on offset hangers.

Typical LEG/MEG
Top Flange Offset Left

Typical LEG
Sloped Down Installation
(MEG/EG similar)

EGQ

See Hanger Options General Notes.

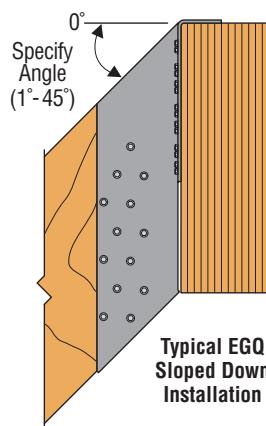

SKEWED SEAT

- The EGQ can be skewed a maximum of 45°.
- The maximum allowable download when skewed is 16,300 lbs.
- The maximum allowable uplift when skewed is 5770 lbs.
- Joist must be bevel cut for skewed seat installation.

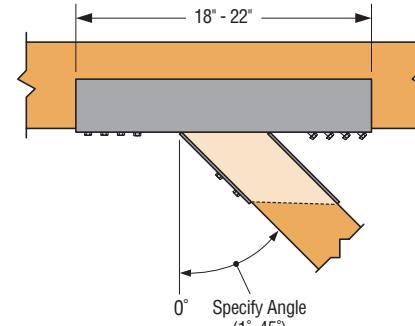

SLOPED SEAT

- The EGQ can be sloped up or down a maximum of 45°.
- The maximum allowable download when sloped is 15360 lbs.
- The allowable uplift when sloped is 100% of the table load.
- Sloped seat installation requires an additional 14 joist screws (supplied with the connector).

NO SLOPED AND SKEwed COMBO AVAILABLE.

Typical EGQ
Sloped Down
Installation

Top View EGQ
Skewed Right

HUTF/HUITF

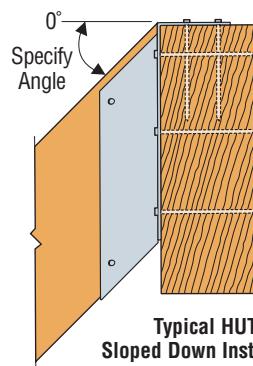

See Hanger Options General Notes.

SLOPED AND/OR SKEwed SEAT

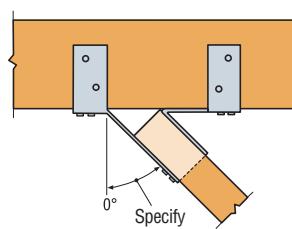

- HUTF can be skewed to a maximum of 45° or sloped down to a maximum of 45°. HUTF can be skewed and sloped down only, provided $W \geq 2\frac{3}{16}$ ".
- Hangers with a skew greater than 15° may have all the joist nailing on the outside angle. No skew with slope up options available.
- For skews greater than 15°, uplift loads are 0.75 of the table loads.
- For sloped and skewed combinations, the allowable loads are 0.70 of the table loads.
- HU43TF may be skewed only 45° at 0.45 of table loads.
No options for HU24-2TF and HU44TF.**
- For sloped down only hangers, allowable load is 0.78 of the table load.

CONCEALED FLANGE

- HUTF is available with one A flange concealed at 0.85 of the catalog table load. HUTF is also available with both flanges concealed provided the W dimension is $2\frac{3}{16}$ " or greater, at 0.85 of the table load. Specify HU43TF for both flanges concealed. No skew options available.

Typical HUTF
Sloped Down
Installation

Top View HUTF Hanger
Skewed Right

HANGER OPTIONS

LGU/MGU/HGU/HHGU/LGUM/HGUM

See Hanger Options General Notes.

CONCEALED FLANGE

- LGU, MGU, HGU, HHGU and HGUM hangers are available with one flange concealed. Specify flange to conceal.
- Allowable Loads for one flange-concealed option:

LGU	1.00 of published load
MGU	0.88 of published load
HGU	0.75 of published load
HHGU	0.75 of published load
HGUM	see table below
- **LGU with W 3 1/4" or less**, MGU with W 4" or less and HGU with W 4 1/16" or less, flanges cannot be concealed.

Concealed Flange – Allowable Loads with One Flange Concealed

Model No.	W (in)	H (in)	Fasteners		End of Wall			Outside corner		
			CMU/Concrete	Joist	CMU Wall DF/SP/SCL Beam		Concrete Wall DF/SP/SCL Beam		CMU/Concrete Wall DF/SP/SCL Beam	
			Titen HD® Anchors	SDS Screws	Uplift (160)	Download	Uplift (160)	Download	Uplift (160)	Download

SKEWED

- LGU, MGU, HGU, LGUM and HGUM hangers are available skewed up to 45°.
- Apply the following reduction factors to published loads:

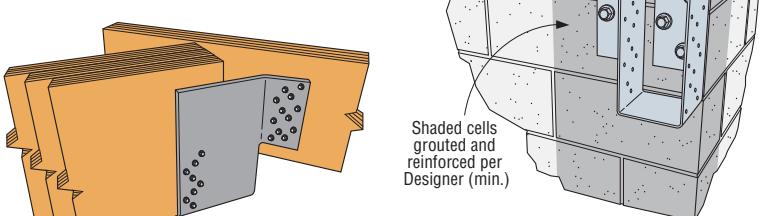

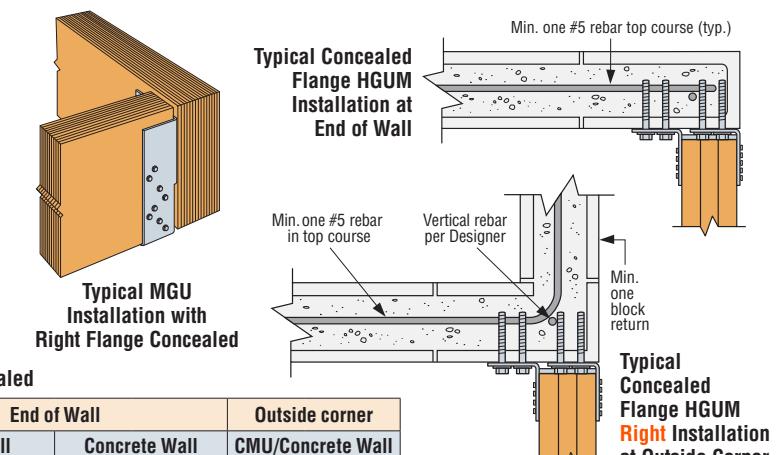

Reduction Factors for Skewed LGU, MGU, HGU

Model	Beam Cut		Download	Uplift
	CMU/Concrete	Joist		
LGU	Square Cut		0.90	0.60
	Bevel Cut		0.90	0.60
MGU/HGU less than 6" wide	Square Cut		0.75	0.65
	Bevel Cut		0.80	0.65
MGU/HGU 6" and wider	Bevel Cut		0.80	0.55

- For LGUM and HGUM see table below.
- Concealed flanges are not available with skewed models.

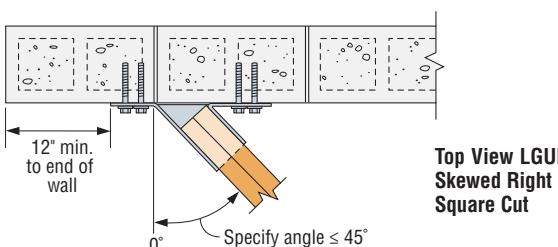

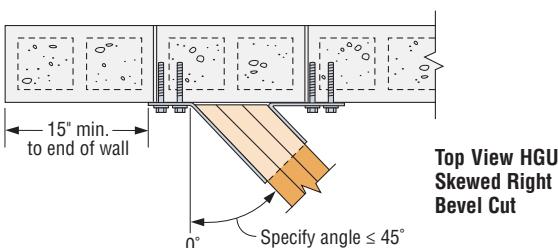

LGUM/HGUM Allowable Loads for Skewed (L/R) Applications

Typical Skewed MGU Installation
(Skewed left shown)

Typical Concealed Flange HGUM Installation at Outside Corner
(Concealed right shown)

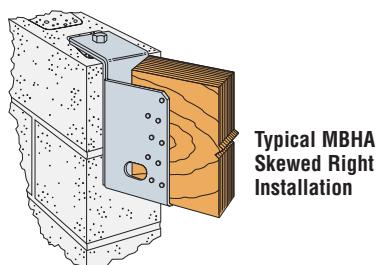

MBHA

See Hanger Options General Notes.

SKEWED SEAT

- Seat can be skewed at 45° only. The maximum allowable download is 3495 lbs. and 1585 lbs. uplift for Height 7 1/4". For all other models, use the table listed download and uplift of 2390 lbs.
- Order MBHAR for skew right and MBHAL for skew left.

CONTINUOUS LOAD TRANSFER PATH

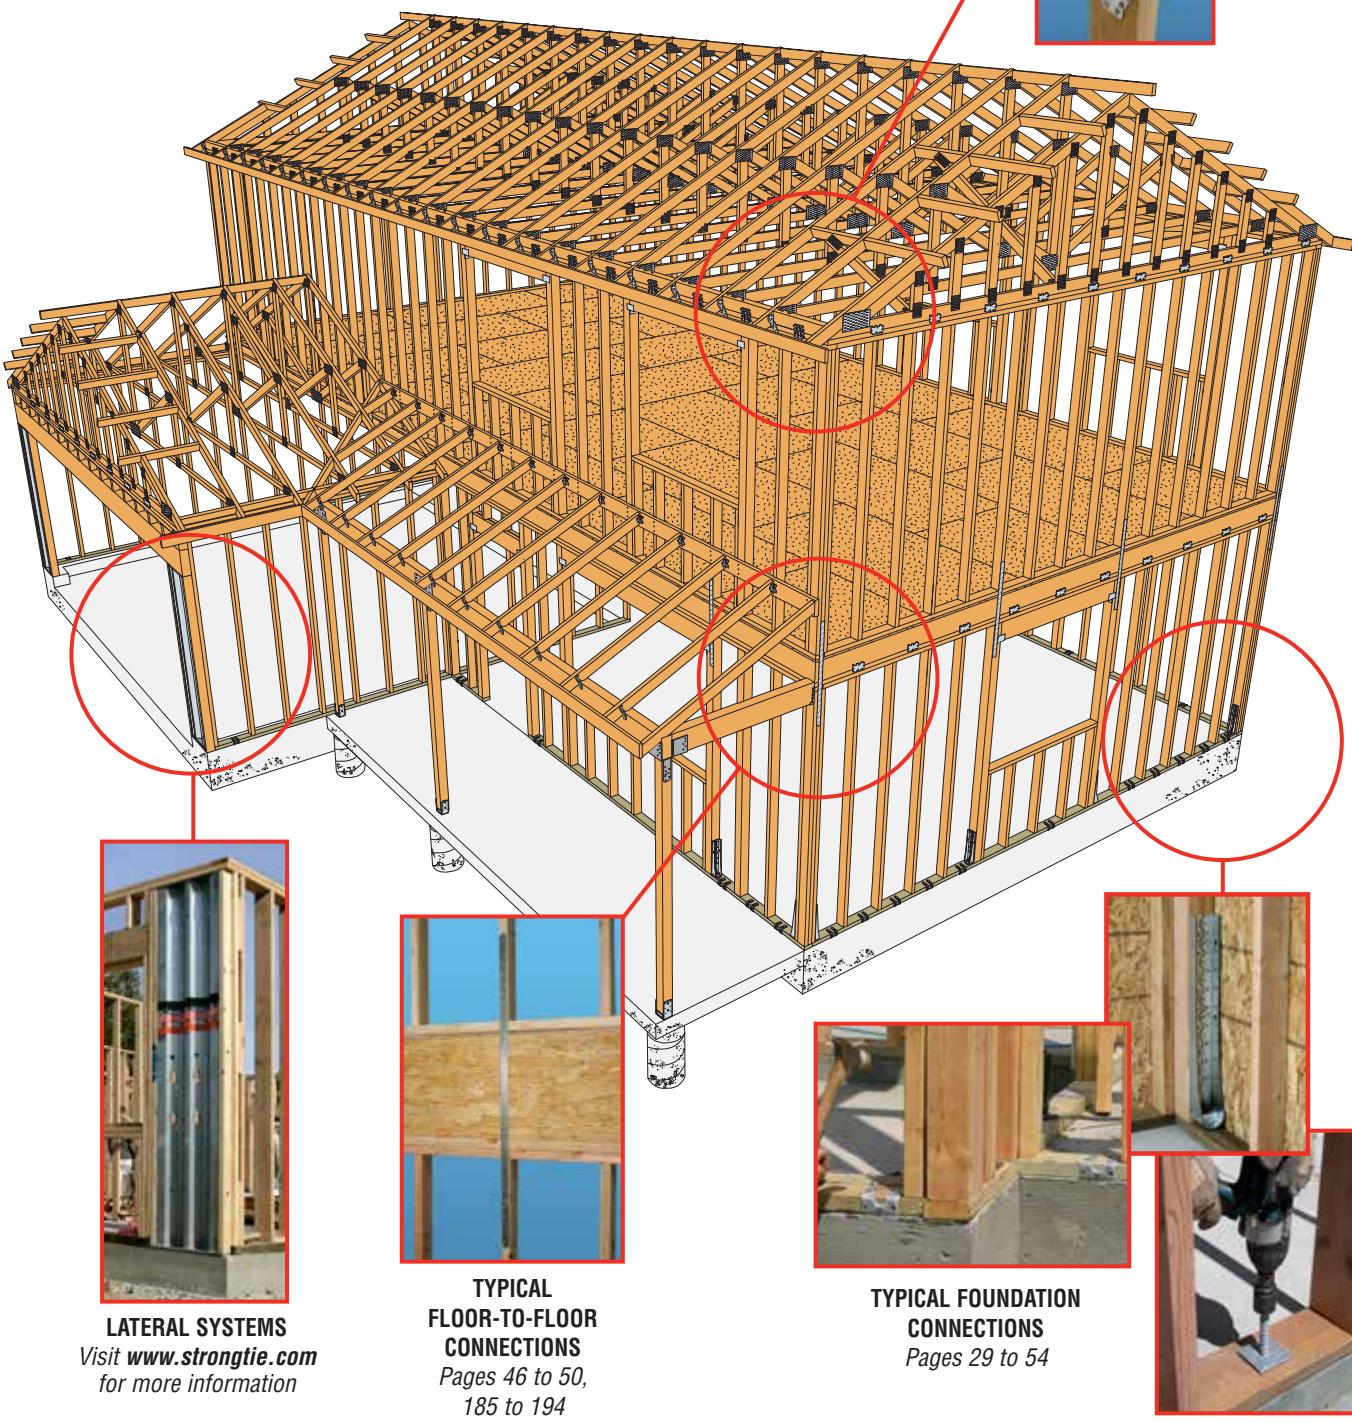

This drawing shows the connection points for a continuous load transfer path from the rafters to the foundation of a two-story house.

Building with a continuous load path is an essential part of creating a structure better able to withstand the forces of mother nature.

This drawing is for illustrative purposes only and should not be considered an engineered system. Refer to the page numbers for the full range of Simpson Strong-Tie® connectors. Consult a qualified Designer to ensure that correct connector quantities and installation methods are used to achieve the full design load values.

	2-2x6	#2	19735	17715	17265	16370	15920
	3-2x6	#2	29600	26575	25900	24555	23885
	4-2x6	#2	39470	35430	34535	32740	31845

1. The allowable (ASD) capacities are based on the 2012 National Design Specification for Wood Construction (NDS) including the March 2013 Addendum, for lumber with a moisture content of 19% or less.

2. Post heights are based on standard precast stud heights and associated top plate heights. For Douglas Fir, wall height is nominal height plus 3/4" (*California stud height*). For all other species, wall height is nominal height plus 1 1/4". Effective post lengths, l_e , are the actual wall height minus the thickness of 3-2x plates (4 1/2").

3. Shaded values are limited by the Perpendicular to Grain bearing capacity, $P_{C\perp}$, when posts bear on wood sill plates. Where posts and sill plates are different species, Designer shall limit allowable load to the lower of the post capacity or the perpendicular to grain capacity for each species used.

4. Perpendicular to grain allowable loads do not include the NDS Bearing Area Factor, C_b . For posts whose bearing area is not closer than 3" from the end of a sill plate, the $P_{C\perp}$ values may be multiplied by C_b .

T (in.)	1.5	2.5	3	3.5	4.5	5.5	≥6
C_b	1.25	1.15	1.13	1.11	1.08	1.07	1

T = Bearing Length (post thickness)

C_b = Bearing Area Factor per NDS 3.10.4

5. Tension loads are based on net section assuming hole size equal to bolt diameter plus 1/16". Tension loads have been increased for wind or seismic loading with no further increase allowed. Reduce where other loads govern.

6. Values do not consider combined axial and out-of-plane bending.

7. Bolt diameter "None" indicates full cross section.

Every day we work hard to earn your business, blending the talents of our people with the quality of our products and services to exceed your expectations. This is our pledge to you.

*This catalog reflects changes in the allowable loads and configurations of some Simpson Strong-Tie Company Inc. products. **This catalog is effective until December 31, 2016**, and supersedes all information in all earlier publications, including catalogs, brochures, fliers, technical bulletins, etc. Use this edition as a current printed reference. Information on allowable loads and configurations is updated annually.*

We post our catalogs on www.strongtie.com. Please visit our site and sign up for any information updates. Allowable loads in this catalog are for the described specific applications of properly installed products. Product modifications, improper loading or installation procedures, or deviations from recommended applications will affect connector allowable load-carrying capacities.

Can You Define Genuine?

We Can.

GENUINE

Simpson Strong-Tie® Connectors

We believe in:

- Doing what's right
- Tackling problems differently
- Sharing our knowledge
- Going the extra mile
- Having the right solutions at the right time
